Green Premium™

Green Premium™

More than 75% of our product sales offer superior transparency on the material content, regulatory information and environmental impact of our products:

- RoHS compliance
- REACh substance information
- Industry leading # of PEP's*
- Circularity instructions

The Green Premium program stands for our commitment to deliver customer valued sustainable performance. It has been upgraded with recognized environmental claims and extended to cover all offers including Products, Services and Solutions.

CO_2 and P&L impact through… Resource Performance

Green Premium brings improved resource efficiency throughout an asset's lifecycle. This includes efficient use of energy and natural resources, along with the minimization of CO_2 emissions.

Cost of ownership optimization through… Circular Performance

We're helping our customers optimize the total cost of ownership of their assets. To do this, we provide IoT-enabled solutions, as well as upgrade, repair, retrofit, and remanufacture services.

Peace of mind through… Well-being Performance

Green Premium products are RoHS and REACh compliant. We're going beyond regulatory compliance with step-by-step substitution of certain materials and substances from our products.

Improved sales through… Differentiation

Green Premium delivers strong value propositions through third-party labels and services. By collaborating with third-party organizations we can support our customers in meeting their sustainability goals such as green building certifications.

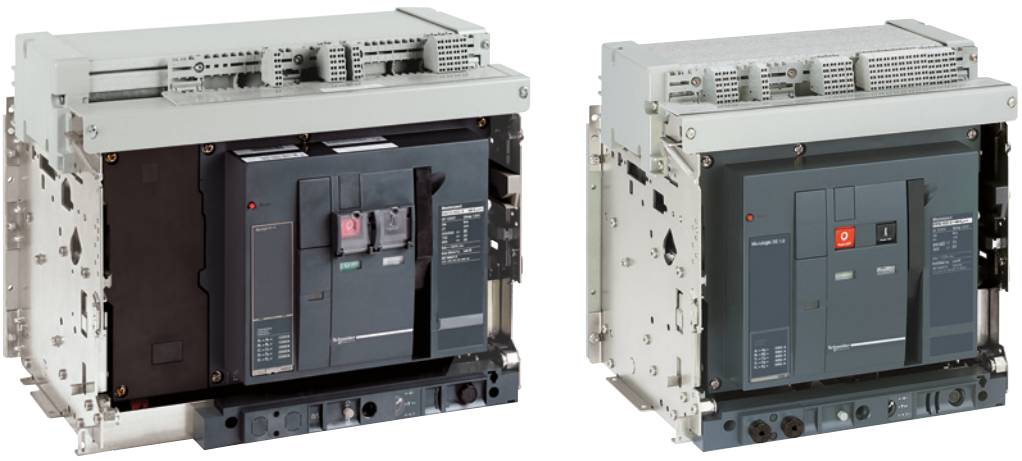
ComPacT NSX, ComPacT INS/INV and MasterPact NW Direct Current

A Complete DC Offer from 16 to 4000 A

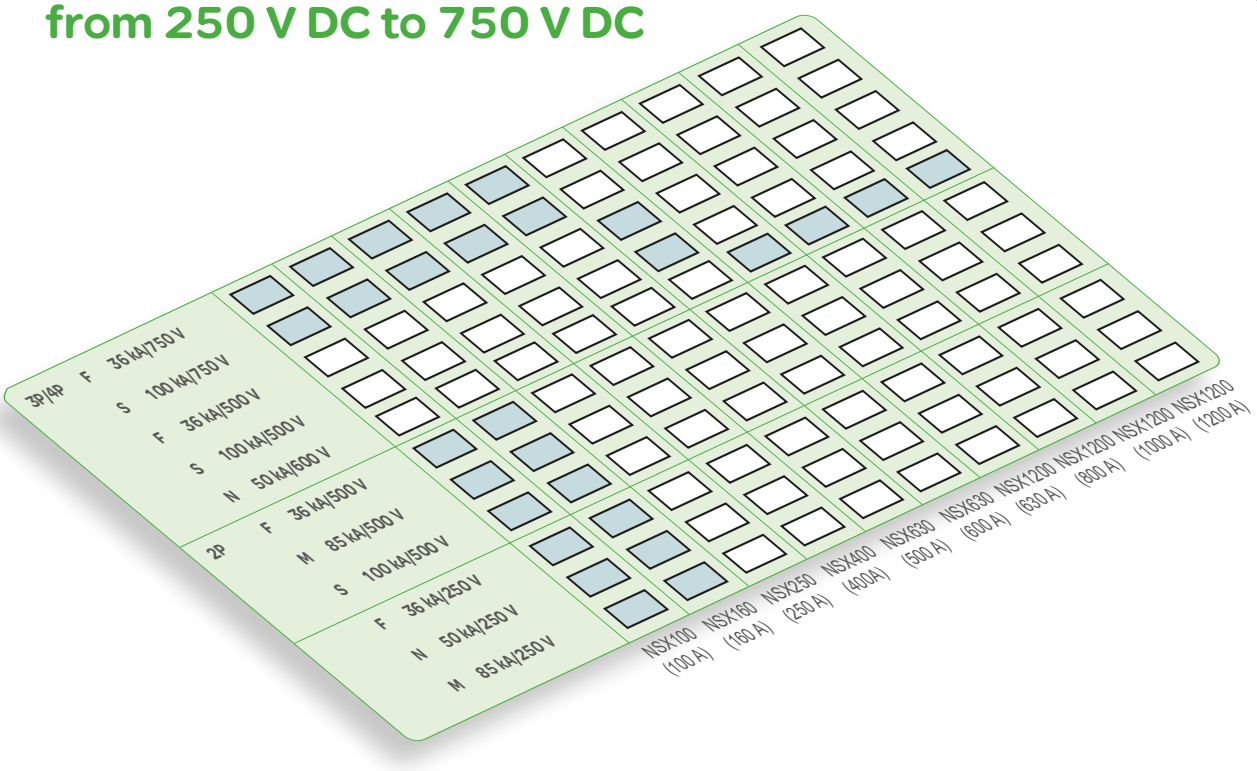
ComPacT NSX, ComPacT INS/INV and MasterPact NW direct current (DC) circuit breakers are used to protect and control low-voltage distribution systems.

They are installed in main low-voltage switchboards (MLVS) and in distribution switchboards (as incomers and outgoers). They can use all the accessories and auxiliaries for the AC ranges and are thus suitable for most DC systems and applications.



A Complete Molded Case Circuit Breaker DC Offer from 80 to 500 A

ComPacT NSX DC from 16 to 1200 A from 250 V DC to 750 V DC



The ComPacT NSX range is designed for DC voltages from 24 to 750 V and offers:

■ A wide selection of models suited to many applications:

□ 1, 2, 3 and 4 poles up to 160 A

□ 3 and 4 poles from 250 to 630 A

□ 2 poles from 630 to 1200 A

■ High breaking capacities, with four performance levels F, N, M and S:

□ F

- 36 kA in a 1 pole version, for systems ⩽ 250 V
- 36 kA in a 2 poles version, for systems ⩽ 500 V
- 36 kA in a 3 or 4 poles version, for systems ⩽ 750 V

□ N

- 50 kA in a 1 pole version, for systems ⩽ 250 V
- 50 kA in a 2 poles version, for systems ⩽ 600 V

□ M

- 85 kA in a 1 pole version, for systems ⩽ 250 V
- 85 kA in a 2 poles version, for systems ⩽ 500 V

□ S

- 100 kA in a 2 poles version, for systems ⩽ 500 V
- 100 kA in a 3 or 4 poles version, for systems ⩽ 750 V

■ Fewer frame sizes: just two poles pitches (35 and 45 mm) for easy integration in installation systems (enclosures, machines, etc.)

■ Accessories for insulation and series or parallel connection of poles, suited to the particularities of DC applications

■ Fixed and withdrawable versions (3 and 4 poles, DC type).

Breaking capacity Icu for 250 V per pole and L/R = 15 ms [1] (1P: 250 V, 2P: 500 V, 3P: 750 V)

[1] L/R = time constant of the distribution system (see page A-11).

NSX1200 DC - 2P

NSX160 DC -1P

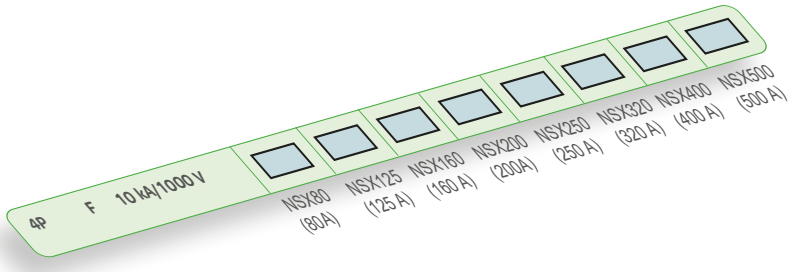
NSX160 DC - 2P

NSX250 DC - 4P

NSX630 DC - 3P

A Complete Molded Case Circuit Breaker DC Offer from 80 to 500 A

ComPacT NSX DC PV from 80 to 500 A at 1000 V DC

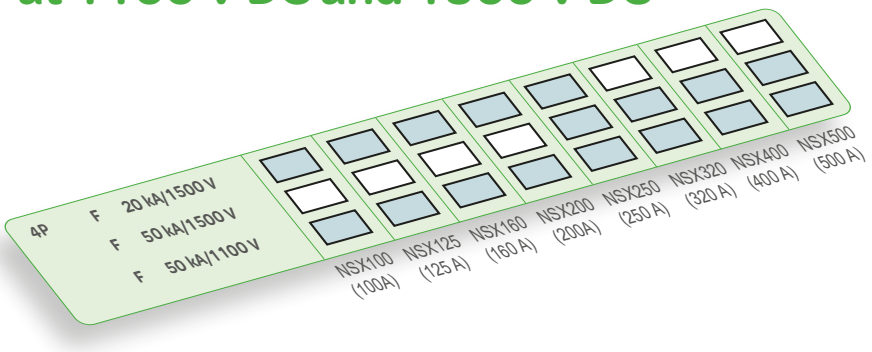


The ComPacT NSX DC PV (Photovoltaic) range is designed for DC voltages under 1000 V and offers:

- Eight current ratings: 80, 125, 160, 200, 250, 320, 400 and 500 A
- A breaking-capacity level F: 10 kA for systems ⩽1000 V
- Two types of devices:
  - Circuit breaker for the protection of power circuits and loads
  - Switch-disconnector for circuit control and disconnection
- Fixed and withdrawable versions for the entire range
- Integrated protection: overload/short circuit protection with thermal magnetic.

ComPacT NSX200 TM DC PV

ComPacT NSX DC EP from 100 to 500 A at 1100 V DC and 1500 V DC



ComPacT NSX250 TM DC EP

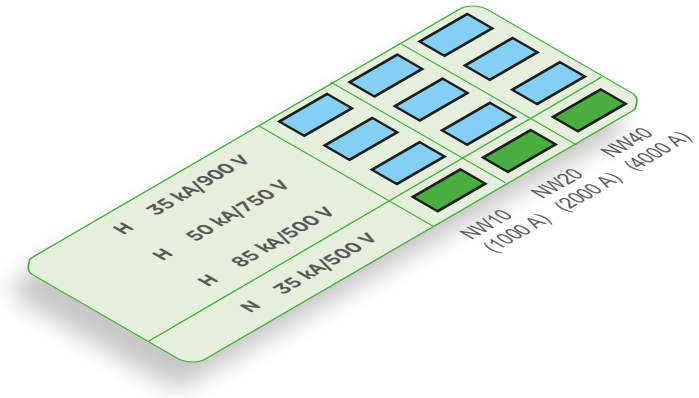
The ComPacT NSX DC EP (Enhanced Performance) range is designed for DC voltages from 1100 to 1500 V and offers:

- Eight current ratings: 100, 125, 160, 200, 250, 320, 400 and 500 A
- Two high breaking-capacity level F:
  - 50 kA for systems ⩽1100 V
  - 50 kA for systems ⩽1500 V
  - 20 kA for systems ⩽1500 V
- Two types of devices:
  - Circuit breaker for the protection of power circuits and loads
  - Switch-disconnector for circuit control and disconnection
- Fixed and withdrawable versions for the entire range
- Integrated protection: Overload/short circuit protection with Thermal magnetic
- Dedicated to specific applications:
  - Photovoltaic application under 1500 V
  - Marine application under 1500 V are also presented in this catalog.

ComPacT NSX500 TM DC EP

A Complete Air Circuit Breaker DC Offer from 16 to 4000 A

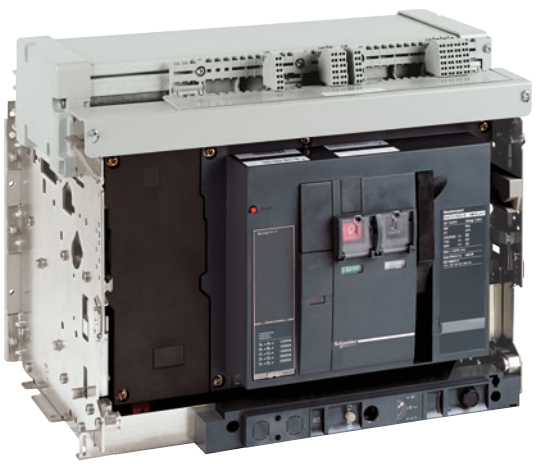
MasterPact NW DC from 1000 to 4000 A



The MasterPact NW range is designed for DC voltages from 24 to 900 V and offers:
■ 2 versions: C/D (3 poles)
E (4 poles)
■ Three current ratings: 1000, 2000 and 4000 A
■ Two high breaking-capacity levels N and H.
Breaking capacity Icu for L/R = 15 ms [1] for 500, 750 or 900 V system voltages:
□ N
- 35 kA for systems ⩽ 500 V
□ H
- 85 kA for systems ⩽ 500 V
- 50 kA for systems ⩽ 750 V
- 35 kA for systems ⩽ 900 V
■ Two types of devices:
□ Circuit breaker for the protection of power circuits and loads
□ Switch-disconnector for circuit control and disconnection
■ Fixed and drawout versions for the entire range.
■ Specific offers dedicated to the specific conditions of some applications:
□ NW HADC-D switch-disconnectors for photovoltaic application under 1000 V DC
□ NW EPDC-D circuit breakers for Marine application under 1100 V DC are also presented in this catalog.

[1] L/R = time constant of the distribution system (see page A-11).

NW10 DC - C/D Version



NW10 DC - E Version

ComPacT NSX DC PV - DC EP, ComPacT INS PV and MasterPact NW DC PV

A Complete DC Offer for Solar Application from 80 to 4000 A

ComPacT NSX DC PV - DC EP

Circuit Breakers and Switch-Disconnectors

Enhancing the Reliability and the Efficiency of your Photovoltaic Installation

Schneider Electric photovoltaic packages give you dependable, clean, and affordable solar power. High quality, highly efficient, and available everywhere, our systems are simple-to-install, giving you a competitive edge. The ComPacT NSX DC PV range of molded case circuit breakers and switch-disconnectors with operational voltage up to 1500 V DC includes the switchgears and the protection components you need to efficiently operate your photovoltaic installation in commercial buildings and power plants.

With heatsinks supplied as standard, the circuit breaker or switch-disconnector rating is optimized, avoiding the need to oversize protection components and saving space in the enclosure. As part of the ComPacT NSX range, all existing auxiliaries and accessories are compatible.
The terminal shields and phase barriers are available for insulation. The shunt trip auxiliary is available for remote disconnection.

ComPacT NSX DC PV - DC EP...

...with short heatsinks

...with long heatsinks

ComPacT INS PV
Switch-Disconnectors

No matter the size or scale of the project, Schneider Electric, has a photovoltaic solution to fit your needs. Fast ROI, high efficiency – it's all a part of our offer as the world leader in energy management.

The INS PV-1 is a direct current switch disconnector dedicated to array isolation and control with Voc until 600 V DC.

Photovoltaic Applications

MasterPact NW HADCD-PV
Switch-Disconnectors

Schneider Electric's MasterPact NW HADCD-PV switch-disconnectors are used for circuit control and disconnection.

Dedicated to Photovoltaic Application

MasterPact NW EPDC-D

Circuit-Breakers for Marine Applications at 1100 V DC

Alternative energies have a major contribution to reducing the carbon footprint in marine industry and building the environmental sustainability of power generation.
Vessels hybrid propulsion systems have continuously been growing worldwide in these last years. The competitive environment together with the increasing power of such systems have created the need for voltage increase on the DC side, in order to limit the cables cross section, to lower the DC power losses, and to reduce the installation costs.

MasterPact NW10-40 EPDC-D is a 1100 V DC air circuit breakers offer tested and certified for marine application.
Marine applications have particular characteristics and require equipment with specific performance. These performance requirements are identified for the IEC 60947-2 products in the IACS UR E10 unified requirements: "Test Specification for marine Type Approval". NW10-40 EPDC-D circuit breakers are certified as per the IEC 60947-2 and the IACS UR E10.

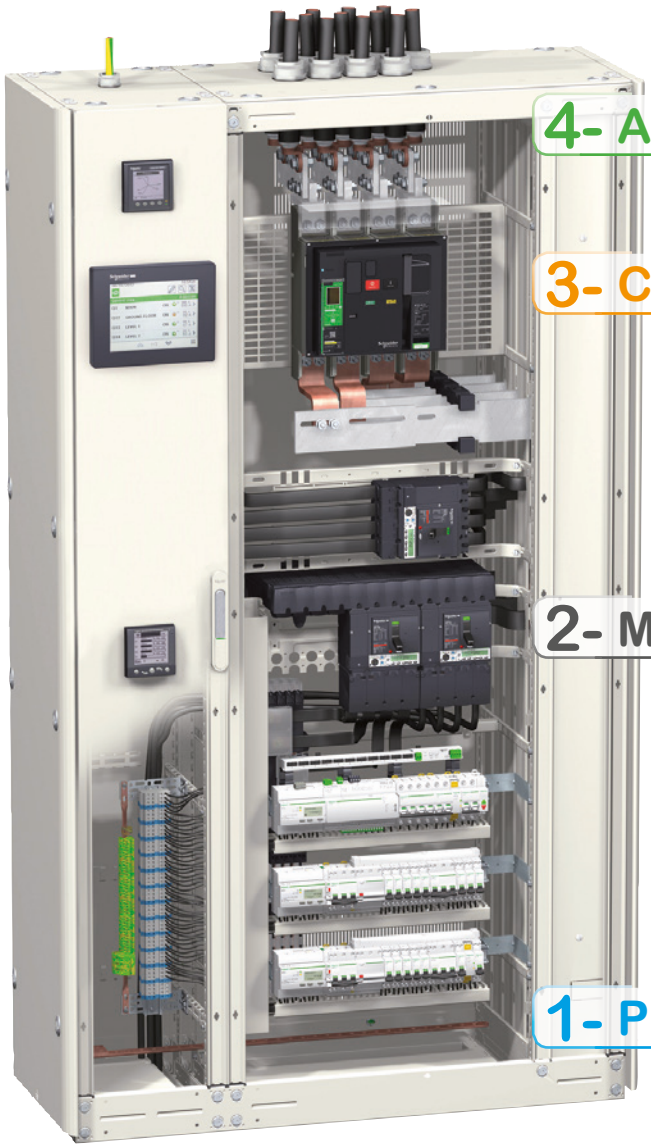
Architecture Overview

Smart Panels
Enerlin'X

Ethernet-Ready Smart Panels

Ethernet-ready Smart Panels enable electrical distribution control and expertise. 'Protect' - 'Measure' - 'Connect' are the 3 pillars of their technology.

PB115758.psd



4- Act

3- Connect

Give a Voice to the Panel

Ethernet network data transmission is now part of the intrinsic design of protection and metering devices

2- Measure

Keeping a Close Eye on Energy Flows

The switchboard plays a key role in capturing building-related data, by gathering the critical protection and metering components.

1- Protect

Electrical Protection is at the Core of Smart Panel

High-performance technology is present in every breaker and every residual current device.

Architecture Overview

Future Savings, Peace-of-Mind

Access to Smart Panel status, values, is essential for taking advantages of monitoring and management services, locally or remotely.

Act in Small/Medium Buildings

A Wide, Complete and High-Performance Range

Schneider Electric DC- DC PV - DC EP circuit breakers and switches provide a comprehensive solution for the many applications met in DC systems.
The ComPacT NSX and MasterPact NW DC ranges offer, a wide selection of current ratings (16 to 4000 A) and breaking capacities (up to 100 kA) for the common voltages up to 900 V DC.
The ComPacT NSX and MasterPact NW DC - DC PV ranges are designed for use under 1000 V for photovoltaic application.
The ComPacT INS/INV offers a wide selection of current ratings (40 to 2500 A) for the common voltage up to 250 V DC.

Flexible and Optimized Design

The ComPacT NSX, ComPacT INS/INV and MasterPact NW DC ranges use all the standard accessories and auxiliaries of the AC ranges.
The modular design and many possibilities offered by these systems provide a high degree of flexibility in customizing products, while benefiting from dependable and optimized industrial design.

Dependable and Simple Operation

Even though they use the accessories of the corresponding AC ranges, the ComPacT NSX, ComPacT INS/INV and MasterPact NW DC ranges have been specially designed for DC systems.
Specific accessories have been developed to meet the needs of series or parallel connection of poles by users in a simple and dependable manner (see page opposite). ComPacT NSX, ComPacT INS/INV and MasterPact NW DC devices can be installed in class II switchboards with a degree of protection up to IP54.

Compliance with Standards

ComPacT NSX, ComPacT INS/INV and MasterPact DC circuit breaker ranges comply with:

- The main international standards and in particular IEC 60947-1/2/3
- European (EN 60947-1 and EN 60947-2) and the corresponding national standards: France NF, Germany VDE, UK BS, Australia AS, Italy CEI
- The specifications of the marine classification companies (Veritas, Lloyd's Register of Shipping, Det Norske Veritas, etc.)
- French standard NF C 79-130 and the recommendations issued by the CNOMO organization for the protection of machine tools. For United States UL, Canadian CSA, Mexican NOM and Japanese JIS standards, please consult us.

ComPacT NSX, ComPacT INS/INV and MasterPact NW DC - DC PV switches and auxiliaries comply with the following:

- The main international standards and in particular IEC 60947-2 (circuit breaker), IEC 60947-3 (switch-disconnectors)
- European (EN 60947-1, EN 60947-2 and EN 60947-3) and the corresponding national standards: France NF, Germany VDE, United Kingdom BS, Australia AS, Italy CEI.

Open Communication

ComPacT NSX and MasterPact NW DC devices can be equipped with communication options for integration in a supervision system via Modbus.

Pollution Degree

ComPacT NSX and MasterPact NW DC circuit breakers are certified for operation under pollution conditions in industrial environments, as per standard IEC 60947, corresponding to:

- Pollution degree 3 (ComPacT NSX, ComPacT INS/INV)
- Pollution degree 3 (MasterPact NW).

Tropicalization

ComPacT NSX, ComPacT INS/INV and MasterPact NW DC circuit breakers have successfully passed the tests prescribed by the following standards for severe atmospheric conditions:

- IEC 60068-2-1 - dry cold (-40 °C)
- IEC 60068-2-1 - dry heat (+85 °C)
- IEC 60068-2-30 - damp heat (95 % relative humidity at +55 °C)
- IEC 68-2-52 (level 2) - salt mist.

Environmental Protection

Schneider Electric circuit breaker ranges benefit from Eco-design:

- Use of environment-friendly materials
- Non-polluting production units complying with ISO 14001 standards
- Filtered breaking for high current ratings to avoid pollution in the switchboard
- Low dissipated energy per pole, making energy losses insignificant
- Marking of products in view of sorting recyclable materials at the end of the service life.

… Specifically for DC- DC PV - DC EP Applications

Designed for Direct Current

Performance Levels and Quality Signed Schneider Electric

The creation of a dependable and high-performance DC range requires a large amount of specific design and development work in addition to that invested in the original AC range.
Schneider Electric called on its proven industrial experience in the AC field and its recognized know-how in current interruption to develop a high-performance DC range.
Schneider Electric decided to use the cases and accessories of its ComPacT NSX and MasterPact NW ranges with:

- A high-performance design for the breaking chambers or the poles intended specifically for DC applications (e.g. 100 kA at 250 V per pole for ComPacT NSX and 85 kA at 900 V for two poles for MasterPact NW)
- Fast trip units developed for DC applications
- Optimized pole-connection and isolation possibilities that are both simple and dependable.

Optimized Solutions for the Many Types of DC Systems

The many types of DC systems make it necessary, for cost and technical-optimization reasons, to connect the poles of two, three or four-pole circuit breakers in series or in parallel.
The ComPacT NSX and MasterPact NW ranges enable series connection of poles, thereby optimizing breaking capacity for high voltages.
Series connection reduces the voltage across the terminals of each pole (the total voltage is divided by two, three or four depending on the circuit breaker) and the operation of all poles provides the breaking capacity of the overall device.
This makes it possible to break short-circuit currents at high voltages while optimizing solutions (e.g. a ComPacT NSX 100 kA 250 V per pole can be used on a 750 V system with three poles connected in series, thus reducing the cost compared to a 750 V solution).
The ComPacT NSX range enables parallel connection of the poles, thereby optimizing the use of the rated currents.

Optimized and Dependable Series or Parallel Connection of Poles

Series Connection - Controlled Temperature Rise and Enhanced Performance

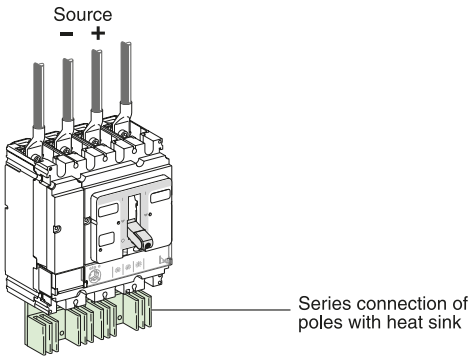
Schneider Electric DC circuit breakers comply with product standards IEC 60947-1 and 2.
To that end, series connection of poles meets:

- Temperature-rise conditions. Connections specifically designed to dissipate heat mean the thermal model is equivalent to that for AC applications. The devices dissipate the temperature rise produced by relatively short series connections.
- Connections are designed for severe operating conditions (insulation and safety clearances, ultimate breaking capacity, high pollution levels, etc.).

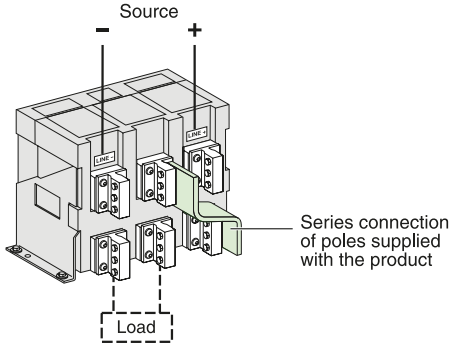
Parallel Connection - Optimization

Certain DC systems require high power levels (hundreds to thousands of amperes) at reduced voltages, most often ≤ 250 V.
The configurations of DC systems and the exceptional performance levels of ComPacT NSX circuit breakers mean the poles can be parallel connected.
This technique virtually doubles, triples or quadruples the current rating depending on the type of circuit breaker and thus reduces the cost of solutions.

ComPacT NSX DC and MasterPact NW DC circuit breakers offer optimized pole-connection possibilities.



ComPacT NSX DC

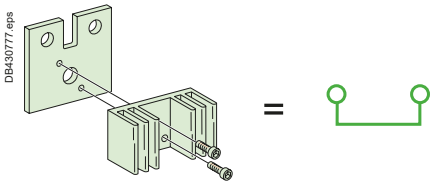


MasterPact NW DC - supplied ready for installation (here with vertical rear connections)

Great Flexibility in Adapting to DC Applications

Overview of Series Connection of Poles for ComPacT NSX DC

With ComPacT NSX DC circuit breakers, it is easy to create a large number of series pole arrangements using prefabricated connections mounted on site during equipment installation.



One type of connection per framesize, two catalog numbers for all series connections.

- All connections are possible for the fixed and withdrawable versions
- Indifferent connection of polarities, from left to right or right to left
- Indifferent connection of upstream and downstream cables to top or bottom terminals
- Series connection of poles is possible by upstream/downstream connections. Creation of the connections is the responsibility of the panel builder or the installer.

Selection Guide for DC Circuit Breakers

Types of DC Distribution Systems

There are three types of DC distribution systems (see the table).
The operational voltage in conjunction with one of the three systems determines the number of poles taking part in current interruption.

Selection of a circuit breaker depends essentially on the distribution-system parameters presented below which are used to determine the corresponding characteristics:

- Type of system - determines the type of product and the number of poles connected in series for each polarity
- Rated voltage - determines the number of series poles taking part in current interruption
- Nominal current - determines the rated current of the circuit breaker
- Maximum short-circuit current at the point of installation - determines the breaking capacity.

Types of systems	Earthed systems		Isolated systems
	The source has one earthed polarity [1]	The source has an earthed mid-point	
Diagrams and different faults			Fault analyzis (neglecting resistance of earth electrodes)			
Fault A	■ Maximum Isc at U ■ Only protected polarity concerned ■ All poles of protected polarity must have breaking capacity ≥ Isc max. at U	■ Maximum Isc at U/2 ■ Only positive polarity concerned ■ All poles of positive polarity must have breaking capacity ≥ Isc max. at U/2	■ No consequences ■ The fault must be indicated by an IMD (insulation-monitoring device) and cleared (standard IEC/EN 60364)
Fault B	■ Maximum Isc at U ■ If only one polarity (the positive here) is protected, all poles of protected polarity must have breaking capacity ≥ Isc max. at U ■ If both polarities are protected, to enable disconnection, all poles of the two polarities must have breaking capacity ≥ Isc max. at U	■ Maximum Isc at U ■ Both polarities are concerned ■ All poles of the two polarities must have breaking capacity ≥ Isc max. at U	■ Maximum Isc at U ■ Both polarities are concerned ■ All poles of the two polarities must have breaking capacity ≥ Isc max. at U
Fault C	No consequences	■ Same as fault A ■ All poles of the Negative polarity must have breaking capacity ≥ Isc max. at U/2	■ Same as fault A with the same actions
Double fault A and D or C and E	Double fault not possible, system trips on first fault	Double fault not possible, system trips on first fault	■ Maximum Isc at U ■ Only positive polarity (cases A and D) or negative (C and E) concerned ■ All poles of each polarity must have breaking capacity ≥ Isc max. at U
Most unfavorable cases			
	Fault A and fault B (if only one polarity is protected)	Fault B	Double fault A and D or C and E
Conclusion: selection of number of poles and breaking capacity			
Layout of protection poles			
	■ On only one polarity [1]	■ Identical for each polarity	■ Identical for each polarity
Number of series poles			
Per polarity	■ All on same polarity	■ Equal	■ Equal
Total	■ 1, 2 or 3 without disconnection ■ 2, 3 or 4 with disconnection	■ 2 or 4 [2]	■ 2 or 4 [2]
Breaking capacity			
	■ All poles of the protected polarity ≥ Isc max. at U	■ All poles of both polarities ≥ Isc max. at U ■ All poles of each polarity ≥ Isc max. at U/2	■ All poles of each polarity ≥ Isc max. at U
Disconnection of both polarities [3]			
	Possible by adding a pole to the non-protected polarity	■ Ensured	■ Ensured
Implementation			
	See the selection table opposite		

[1] Positive or negative, depending on the polarity connected to the exposed conductive parts.
[2] A 3P circuit breaker can be used if a 2P version does not exist. In this case, the central pole is not connected.
[3] Disconnection made possible by multi-pole breaking.

Type H

24 V ⩽ Un ⩽ 500 V		 Version D	 Version C	 Version E
500 V < Un ⩽ 750 V		 Version D	 Version E	 Version E
750 V < Un ⩽ 900 V		 Version D	 Version E	 Version E

[1] A 3P circuit breaker can be used if a 2P version does not exist. In this case, the central pole is not connected.

[2] ComPacT NSX DC circuit breakers (and switch disconnectors) are designed to break the rated current or fault current at the rated operational voltage (Ue) with all poles. To break the current at voltage > 500 V, three poles in series are required. In double earth fault situations (A + D or C + E), the circuit breaker (and Switch disconnectors) must break the current at full voltage with only half of the poles. ComPacT NSX DC circuit breakers (and Switch disconnectors) are not designed for this purpose and could sustain irremediable damage if used to break the current in a double earth fault situation for voltage > 500 V.

To break the current at voltage > 250 V, two poles in series are required. In double earth fault situations (A + D or C + E), the circuit breaker (and switch disconnectors) must break the current at full voltage with only half of the poles. ComPacT NSX DC circuit breakers (and switch disconnectors) are not designed for this purpose and could sustain irremediable damage if used to break the current in a double earth fault situation for voltage > 250 V.
[2] Do not remove parallel connectors.
[3] ComPacT NSX DC circuit breakers (and switch disconnections) are designed to break the rated current or fault current at the rated operational voltage (Ue) with all poles. To break the current at voltage > 300 V, two poles in series are required. In double earth fault situations (A + D or C + E), the circuit breaker (and switch disconnectors) must break the current at full voltage with only half of the poles. ComPacT NSX DC circuit breakers (and switch disconnectors) are not designed for this purpose and could sustain irremediable damage if used to break the current in a double earth fault situation for voltage > 300 V.

Selection Guide for DC Circuit Breakers

Solutions Depending on the Distribution System and the Voltage

Comparison of Series and Parallel Connection in Terms of Performance

Series connection of poles on a DC circuit breaker is the means to:

- Divide the system voltage by the number of poles
- Use the rated current for each pole
- Use the breaking capacity of the circuit breaker for all the poles.

For example, a ComPacT NSX630, 3P DC type, with the three poles connected in series, provides:

- A maximum voltage of 750 V (250 V per pole)
- A rated current of 630 A
- A breaking capacity of 100 kA/750 V.

Consequently, a 630 A/250 V device can be used in a 750 V system.

Series connection of poles divides the voltage per pole and optimizes breaking capacity for high-voltage systems.

Parallel connection of poles, on the contrary, imposes the system voltage on each pole, but is the means to:

- Divide the current flowing through each pole by the number of poles
- Increase the rated current.

For example, the same ComPacT NSX630 DC 3P circuit breaker with three poles in parallel provides:

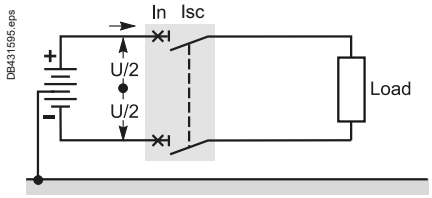
- A maximum voltage of 250 V (250 V per pole)
- A rated current of 1500 A (**see table page B-9**).

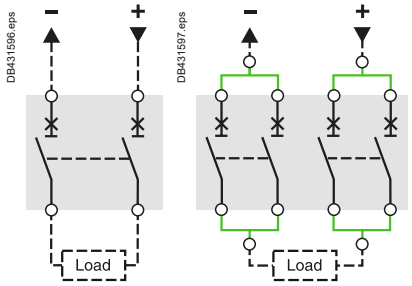
Consequently, a 630 A device used in a 250 V system can handle 1500 A.

Parallel connection of poles divides the current per pole and optimizes the rated current for systems that do not exceed the withstand voltage of each pole.

The maximum useable rating and the value of the magnetic setting are indicated (see pages B-7, B-8 and B-9).

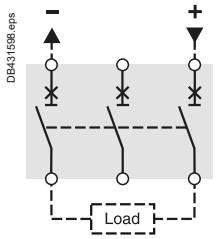
Selection Guide for DC Circuit Breakers
Examples of Circuit Breaker Selection



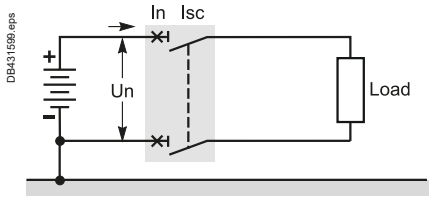


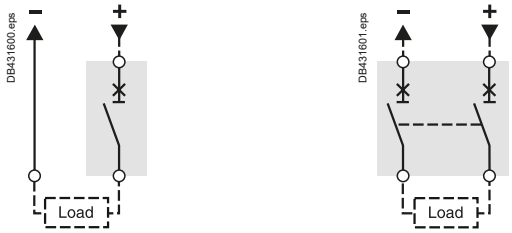
Selection 1

Selection 2: ComPacT NSX160 DC 4P 2 x 2P parallel mounted in series



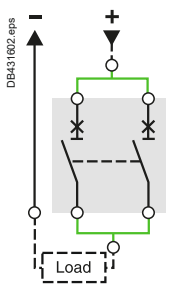
Selection 3: ComPacT NSX250 DC 3P with 2P connected





Selection 1: ComPacT NSX160F DC 1P

Selection 2



Selection 3: ComPacT NSX100N 2P DC in parallel

Selection of a ComPacT NSX DC

Example 1

- Type of system - mid-point connected to earth
- System voltage - Un = 500 V DC with time constant L/R = 5 ms
- Rated current required at point of installation In = 250 A
- Short-circuit current at the point of installation Isc = 20 kA

Selection constraints - (see page A-4)

The system with the mid-point connected to earth requires (see conclusion page A-4):

- Identical protection-pole layout for each polarity.
- An equal number of poles for each polarity, i.e. a total of two or four.
- All poles of the two polarities must have breaking capacity ⩾ Isc max. at Un, I.e. 20 kA/500 V in this case.
- All poles of the each polarity must have breaking capacity ⩾ Isc max. at Un/2, I.e. 20 kA/250 V in this case.

Selection possibilities - (see pages A-5 and A-6)

The tables indicate for 250 V < Un ⩽ 500 V and for this system:

- Poles connected in series: two-pole 2P in series ➡ **selection 1**
- Poles connected in parallel: four-pole 2 x 2P parallel connected in series ➡ **selection 2**.

Circuit breaker selection - (see pages A-14 and B-8)

- **Selection 1**: The 250 A rated current does not exist in 2P. It is possible to use a 250 A 3P DC type circuit breaker with the central pole not connected ➡ **selection 3**
- **Selection 2**:The 160 A rated current (DC version) is suitable with a 2 x 2P assembly connected in parallel because (see table page B-8):
  - ☐ The rated current of the 2 x 2P assembly connected in parallel is In = 288 A > 250 A
  - ☐ And for L/R = 5 ms:
  - Breaking capacity of all poles = 36 kA/500 V > 20 kA/500 V
  - Breaking capacity of poles of each polarity = 36 kA/250 V > 20 kA/250 V.

The options are:

- **Selection 1**: ComPacT NSX250S DC, 3P, 2 poles connected
- **Selection 3**: ComPacT NSX160 DC, 4P, 2 x 2P parallel connected in series.

Both solutions exist in fixed and withdrawable configurations.

Trip unit selection

- ComPacT NSX250 DC 3P: The selection table (see page A-18) indicates 3 TM250DC trip units, which are interchangeable
- ComPacT NSX160 DC, 4P (2 x 2P) 160 A: The selection table (see page B-8) indicates, for the 2 x 2P parallel configuration mounted in series and for 250 A, A TM125DC trip unit with the magnetic-protection threshold set to 2500 A.

Example 2

- Type of system - one polarity earthed
- System voltage - Un = 250 V DC with time constant L/R = 5 ms
- Rated current required at point of installation In = 160 A
- Short-circuit current at the point of installation Isc = 20 kA.

Selection constraints - (see page A-4)

The system with one polarity connected to earth requires (see conclusion page A-4):

- Protection poles on the protected polarity
- All poles contribute to breaking for the polarity:
  - ☐ 1, 2 or 3P without disconnection of the two polarities
  - ☐ 2, 3 or 4P with disconnection of the two polarities
- All poles of the protected polarity must have breaking capacity ⩾ Isc max. at Un, i.e. 20 kA/250 V in this case.

Selection possibilities - (see pages A-5 and A-6)

The tables indicate for Un ⩽ 250 V and for this system:

- Poles connected in series: single-pole ➡ **selection 1** (or two-pole with disconnection ➡ **selection 2**)
- Poles connected in parallel: two-pole ➡ **selection 3**
- Other selections (parallel connection) are possible, but are of no particular interest.

Circuit breaker selection - (see pages A-14 and B-7)

- **Selection 1**: ComPacT NSX160F DC, 1P, 36 kA, available in fixed version (or **selection 2**: ComPacT NSX160F DC, 2P, 36 kA, if disconnection of the two polarities is desired)
- **Selection 3**: ComPacT NSX100N DC, 2P in parallel, 36 kA, providing a rated current of 200 A (see table page B-7), available in fixed version.

Trip unit selection

- ComPacT NSX160N DC, 1P: The selection table (see page A-18) indicates a built-in TM160DC trip unit with the magnetic-protection threshold set to 1250 A
- ComPacT NSX100N DC, 2P in parallel: The selection table (see page B-7) indicates, for the 2P parallel configuration and for 160 A, a TM80D trip unit with the magnetic-protection threshold set to 1600 A.

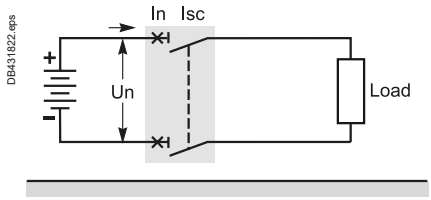
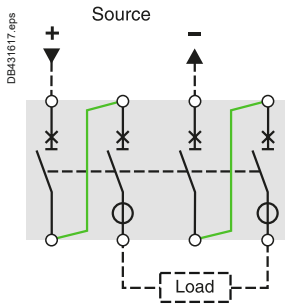
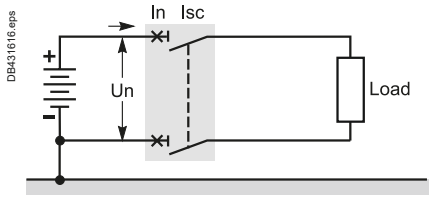
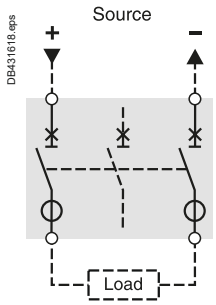
Selection Guide for DC Circuit Breakers
Examples of Circuit Breaker Selection





MasterPact NW20H DC version E





MasterPact NW10N DC version C

Selection of a MasterPact NW DC

Example 1

- Type of system - isolated polarities
- System voltage - Un = 750 V DC with time constant L/R = 30 ms
- Rated current required at point of installation In = 2000 A
- Short-circuit current at the point of installation Isc = 40 kA

Selection constraints - (see page A-4)
The system with isolated polarities requires (see conclusion page A-4):
- Identical protection for each polarity
- An equal number of poles for each polarity, i.e. a total of two or four
- All poles of each polarity must have breaking capacity ≥ Isc max. at Un, I.e. 40 kA/750 V in this case.

Selection possibilities - (see page A-5)
The table for series poles indicates for a voltage 24 V < Un ≤ 750 V and the type of system, use of a four-pole, version E circuit breaker.

Circuit breaker selection - (see page A-102)
The MasterPact NW DC characteristics table indicates more specifically with a 2000 A a NW20 DC type H circuit breaker with a breaking capacity of 50 kA/750 V (L/R = 30 ms).
The correct selection is a MasterPact NW20 DC type H version E, 2000 A, 50 kA, available in fixed and drawout versions.

Example 2

- Type of system - one polarity earthed
- System voltage - Un = 500 V DC with time constant L/R = 15 ms
- Rated current required at point of installation In = 1000 A
- Short-circuit current at the point of installation Isc = 30 kA

Selection constraints - (see page A-4)
The system with one polarity connected to earth requires (see conclusion page A-4):
- Protection poles on the protected polarity
- All poles contribute to breaking for the polarity:
  - 1, 2 or 3P without disconnection of the two polarities
  - 2, 3 or 4P with disconnection of the two polarities
- All poles of the protected polarity must have breaking capacity ∅ Isc max. at Un, i.e. 30 kA/500 V in this case.

Selection possibilities - (see page A-5)
The table for series poles indicates for a voltage 24 V < Un ≤ 500 V and the type of system, use of a three-pole, version C circuit breaker.

Circuit breaker selection - (see page A-102)
The MasterPact NW DC characteristics table indicates more specifically with a 1000 A a NW10 DC type N circuit breaker with a breaking capacity of 35 kA/500 V (L/R = 15 ms). The correct selection is a MasterPact NW10 DC type N version C, 1000 A, 35 kA, available in fixed and drawout versions.

Calculation of DC Distribution-System Characteristics

Short-Circuit Currents L/R Time Constant

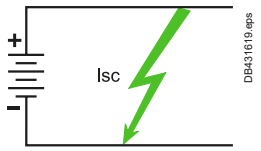
Short-Circuit Currents

Calculation of the short-circuit current across the terminals of a battery

During a short-circuit, the battery discharges a current equal to:

$$Isc = \frac{Vb}{Ri}$$

- Vb = maximum discharge voltage (battery 100 % charged)
- Ri = internal resistance equivalent to all cells (a function of the capacity in ampere-hours).



Example

- Consider a set of four 500 Ah batteries connected in parallel.
- Discharge voltage of one battery: 240 V (110 cells 2.2 V each).
- Discharge current of one battery: 300 A with a run-time of 30 minutes.
- Discharge current of all four batteries: 1200 A with a run-time of 30 minutes.
- Internal resistance 0.5 mΩ per cell, i.e. for one battery:
  $Ri = 110 \times 0.5 \times 10^{-3} = 55 \times 10^{-3}\ \Omega$.
- Short-circuit current of one battery: $Isc = 240\ V / 55 \times 10^{-3}\ \Omega = 4.37$ kA.
- Neglecting the resistance of the connections, for all four batteries discharging the short-circuit current in parallel, the total short-circuit current is four times that of one battery, i.e. Isc = 4 x 4.37 kA = 17.5 kA.

Note: If the internal resistance is not known, it is possible to use the following rough approximation: Isc = kc where c is the capacity of the battery in ampere-hours and k is a coefficient close to 10 and always less than 20.

Other typical examples

- PABXs: Isc from 5 to 25 kA at 240 V DC with L/R = 5 ms.
- Submarine: Isc from 40 to 60 kA at 400 V DC with L/R = 5 ms.

L/R Time Constant

When a short-circuit occurs across the terminals of a DC circuit, the current rises from the load current (≤ In) to the short-circuit current Isc over a period of time that depends on the value of the resistance R and inductance L of the short-circuited loop.

The equation determining the current in the loop is:

$U = Ri + L\,\Delta i/\Delta t$

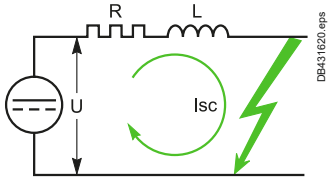
The curve of I versus time is defined (neglecting In) by the equation:

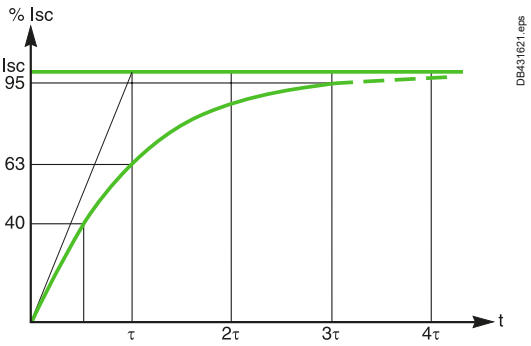
$I = Isc\,(1 - \exp(t/\tau))$

where $\tau = L/R$ is the time constant for the rise to Isc.

Practically speaking, after a time $t = 3\tau$, the short-circuit is considered to be established, because the value of exp(-3) = 0.05 is negligible compared to 1 (see the curve opposite).

The lower the time constant (e.g. battery circuit), the shorter the time required for the current to rise to Isc.





To express breaking capacity, the interrupted short-circuit current with the following time constants is used:

- L/R = 5 ms, fast short-circuit
- L/R = 15 ms, standardized value used in standard IEC 60947-2
- L/R = 30 ms, slow short-circuit.

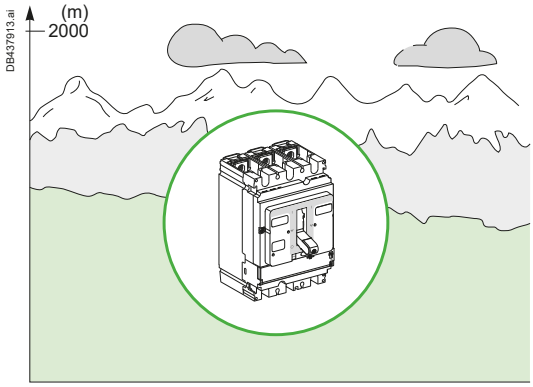
In general, the value of the system time constant is calculated under worst-case conditions, across the terminals of the generator.

Breaking-capacity values for:

- ComPacT NSX DC (table page A-14) are the same for 5 ms and 15 ms
- MasterPact NW DC (table page A-102) are indicated for 3 values, 5 ms, 15 ms And 30 ms.

General Characteristics of ComPacT NSX DC, DC PV and DC EP

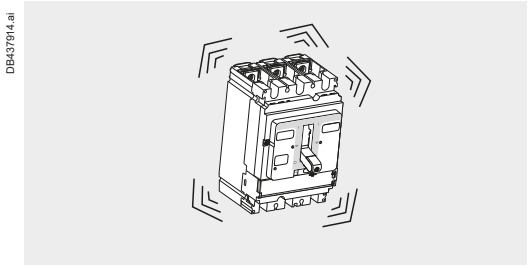
Operating Conditions



Altitude

ComPacT NSX circuit breakers are designed to operate at their rated values at altitudes under 2000 metres.
Above 2000 metres, the changes in the characteristics of the ambient air (electrical resistance, cooling capacity) result in a reduction of the characteristics below.

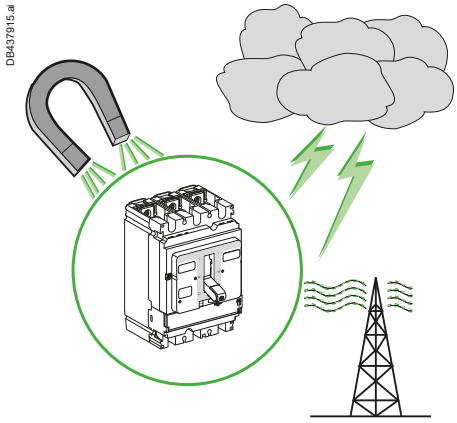
Altitude (m)	2000	3000	4000	5000
ComPacT NSX DC				
Impulse withstand voltage Uimp (kV)	8	7.1	6.4	5.6
Rated insulation voltage (Ui)	750	710	635	560
Maximum rated operationnal DC voltage	1 x Ue	0.88 x Ue	0.8 x Ue	0.7 x Ue
Rated current (A)	1 x In	0.96 x In	0.93 x In	0.9 x In
ComPacT NSX DC PV				
Impulse withstand voltage Uimp (kV)	8	7.1	6.4	5.6
Rated insulation voltage (Ui)	1000	900	800	700
Maximum rated operationnal DC voltage	1000	900	800	700
Rated current (A)	1 x In	0.96 x In	0.93 x In	0.9 x In
ComPacT NSX DC EP				
Impulse withstand voltage Uimp (kV)	8	7.1	6.4	5.6
Rated insulation voltage (Ui)	1600	1400	1250	1100
Maximum rated operationnal DC voltage	1500	1300	1150	1000
Rated current (A)	1 x In	0.96 x In	0.93 x In	0.9 x In



Vibrations

ComPacT NSX circuit breakers are are tested electromagnetic or mechanical vibration resistant.
Tests are carried out in compliance with standard IEC 60068-2-6 for the levels required by merchant-marine inspection organizations (Veritas, Lloyd's, etc.):
- 2 to 13.2 Hz: amplitude ±1 mm
- 13.2 to 100 Hz: constant acceleration 0.7 g.

Excessive vibration may cause tripping, breaks in connections or damage to mechanical parts.



Electromagnetic Compatibility

ComPacT NSX circuit breakers are tested against:
- Overvoltages caused by devices that generate electromagnetic disturbances
- Overvoltages caused by atmospheric disturbances or by a distribution-system outage (e.g. failure of a lighting system) and devices emitting radio waves (radios, walkie-talkies, radar, etc.)
- Electrostatic discharges produced by users. The circuit breakers have successfully passed the electromagnetic-compatibility tests (EMC) defined by international standard IEC 60947-2, appendix F.

The above tests show that:
- No nuisance tripping occurs
- Tripping times are respected.

ComPacT NSX circuit breakers comply with the following electromagnetic-compatibility standards:
- IEC/EN 61000-4-2 - electrostatic immunity discharge test, part 2 (circuit breakers)
- IEC/EN 61000-4-3 - electromagnetic-field immunity test
- IEC/EN 61000-4-4 - electrical fast transient/burst immunity test
- IEC/EN 61000-4-5 - surge immunity test
- IEC/EN 61000-4-6 - immunity to conducted disturbances, induced by radiofrequency fields
- CISPR 11 - radio-frequency conducted and radiated emission tests required for CE marking:
  - EN 61000-6-2 - immunity standard for industrial environments
  - EN 50081-1-2 - emissions in commercial and industrial environments.

Ambient Temperature

Operating-Temperature Range

- ComPacT NSX circuit breakers and switches may be used between -25 °C and +70 °C.
- For temperatures higher than 40 °C (65 °C for circuit breakers used to protect motor feeders), devices must be derated as indicated in the documentation.
- Circuit breakers and switches should be put into service under the normal, ambient operating temperatures indicated above. Exceptionally, they may be put into service when the ambient temperature is between -35 °C and -25 °C.

Derating

Above 40 °C, it is necessary to take into account the derating values.

Storage-Temperature Range

ComPacT NSX circuit breakers and switches may be stored in their original packing between -50 °C and +85 °C.

General Characteristics of ComPacT NSX DC, DC PV and DC EP

ComPacT NSX DC and DC PV

Installation in Class II Switchboards

All ComPacT NSX DC circuit breakers are class II front-face devices. They may be installed through the door of class II switchboards (as per standard IEC 60664) without downgrading switchboard insulation. ComPacT NSX DC EP should be either installed in IP5x enclosure or with rotary handles or IP43 rubber toggle covers. Installation requires no special operations even when the circuit breaker is equipped with a rotary handle or a motor mechanism.

Degree of Protection

ComPacT NSX DC circuit breakers offer the following protection characteristics depending on the installation conditions:

- IP: Degree of protection (standard IEC 60529)
- IK: Protection against external mechanical imPacTs (standard EN 50102).

ComPacT NSX DC

	CNOMO	IP54	IK07
DB437920.ai 	With extended rotary handle	IP55	IK08
DB431630.eps 	With motor mechanism	IP40	IK07

Positive Contact Indication

ComPacT NSX DC circuit breakers are suitable for isolation as defined by IEC 60947-1 and 60947-2:

- The isolation position corresponds to the O (OFF) position
- The operating handle and the indicators cannot indicate the OFF position unless the contacts are effectively open
- Padlocks may not be installed unless the contacts are open.

The isolation function is certified by tests to achieve:

- The mechanical reliability of the position-indication system
- The absence of leakage currents
- Overvoltage withstand capacity between upstream and downstream connections.

For ComPacT NSX DC, installation of a rotary handle or a motor mechanism does not alter the reliability of the position-indication system.

[1] Number of poles in series taking part in current interruption.
Example. The NSX100N DC circuit breaker exists in the following versions:
- 1 pole with an Icu of 50 kA, for systems ⩽ 250 V
- 2 poles with an Icu of 85 kA, for systems ⩽ 500 V; 1 pole can be used in a 250 V system.

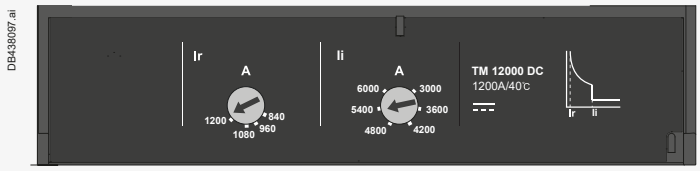
Trip Units for ComPacT NSX DC

TM Thermal-Magnetic Trip Unit up to 1200 A



Up to 1200 A for ComPacT NSX DC, protection is provided by thermal-magnetic trip units.

- TM-D up to 160 A: Fixed thermal threshold and magnetic pick-up.
- TM-D up to 63 A: Adjustable thermal threshold and fixed magnetic pick-up.
- TM-DC from 80 to 250 A: Fixed or adjustable (for 200 and 250 A) magnetic pick-up and adjustable thermal threshold.
- TM-DC from 250 A to 1200 A adjustable magnetic pick-up and adjustable thermal threshold.
- TM-G, up to 250 A: Adjustable thermal threshold and fixed low magnetic pick-up to protect long cables.
- TM-G DC, up to 250A: Adjustable thermal threshold and fixed low magnetic pick-up to protect long cables.

Switch-Disconnectors

Characteristics and Performance of ComPacT NSX Switch-Disconnectors from 100 to 250 NA

Installation standards require upstream protection. However ComPacT NSX100 to 630 NA switch-disconnectors are self-protected by their high-set magnetic release.

Electrical and Mechanical Accessories
ComPacT NSX100 to 1200 DC

ComPacT NSX DC circuit breakers may be installed horizontally, vertically or flat on their back, without derating performance levels.
There are three installation versions:
- Fixed
- Plug-in (on a base)
- Withdrawable (on a chassis).

For the last two, components must be added (base, chassis) to the fixed version. Many connection components are shared by the three versions.

Fixed Circuit Breakers NSX100 to NSX1200

Fixed circuit breakers are designed for standard connection using bars or cables with lugs. Bare-cable connectors are available for connection to bare copper or aluminium cables.
For connection of large cables, a number of solutions with spreaders may be used for both cables with lugs or bare cables.

Plug-in Base Circuit Breakers NSX100 to NSX630 [1]

The plug-in version makes it possible to:
- Extract and/or rapidly replace the circuit breaker without having to touch the connections on the base.
- Allow for the addition of future circuits by installing bases that will be equipped with a circuit breaker at a later date.
- Isolate the power circuits when the device is mounted on or through a panel. It acts as a barrier for the connections of the plug-in base. Insulation is made complete by the mandatory short terminal shields on the device. The degrees of protection are:
  - Circuit breaker plugged in = IP4
  - Circuit breaker removed = IP2
  - Circuit breaker removed, base equipped with shutters = IP4.

Parts of a plug-in configuration

A plug-in configuration is made by adding a "plug-in kit" to a fixed device.
To avoid connecting or disconnecting the power circuits under load conditions, a safety trip causes automatic tripping if the device is ON, before engaging or withdrawing it. The safety trip, supplied with the kit, must be installed on the device. If the device is disconnected, the safety trip does not operate. The device can be operated outside the switchboard.

Accessories

Optional insulation accessories are available.
- Terminal shields to protect against direct contact.
- Interphase barriers to reinforce insulation between phases and to protect against direct contact.

Mounting

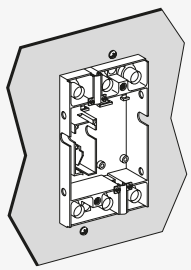
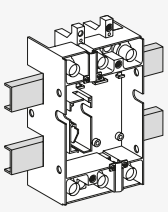
Mounting on a backplate

DB431643.eps



Mounting through a front panel

DB431644.eps



Mounting on rails

[1] Applicable for circuit breaker up to 600 A see page A-14 to A-17.

Withdrawable Circuit Breakers NSX100 to NSX630 [1]

In addition to the advantages provided by the base, installation on a chassis facilitates handling. It offers three positions, with transfer from one to the other after mechanical unlocking:

- Connected: the power circuits are connected
- Disconnected: the power circuits are disconnected, the device can be operated to check auxiliary operation
- Removed: the device is free and can be removed from the chassis.

Parts of a withdrawable configuration

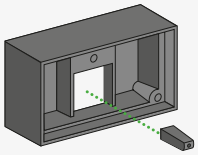
A withdrawable configuration requires two side plates installed on the base and two sides plates mounted on the circuit breaker. Similar to the plug-in version, a safety trip causes automatic tripping if the device is ON, before engaging or withdrawing it, and enables device operation in the disconnected position.

Accessories

Accessories are the same as for the base, with in addition:

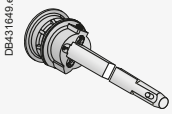
- Auxiliary contacts for installation on the fixed part, indicating the “connected” and “disconnected” positions
- Locking by 1 to 3 padlocks (shackle diameter 5 to 8 mm), to:
  - Prevent insertion for connection
  - Lock the circuit breaker in connected or disconnected position
- Toggle collar for circuit breakers with a toggle mounted through a front panel, intended to maintain the degree of protection whatever the position of the circuit breaker (supplied with a toggle extension)
- Telescopic shaft for extended rotary handles. The door can then be closed with the device in the connected and disconnected positions.

DB431648.eps



Protection collar for toggle and toggle extension to provide IP4 in the connected and disconnected positions

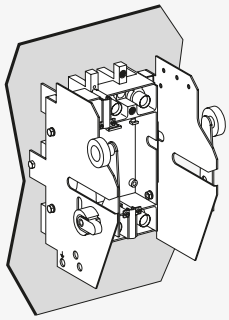
DB431649.eps



Telescopic shaft

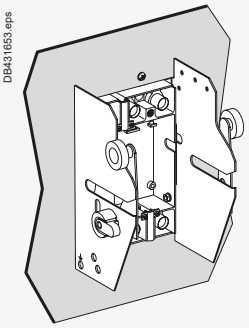
Mounting

DB431650.eps



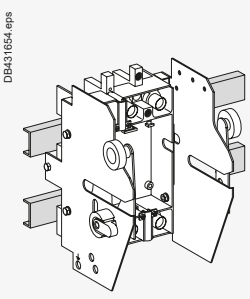
Mounting on a backplate

DB431653.eps



Mounting through a front panel

DB431654.eps



Mounting on rails

[1] Applicable for circuit breaker up to 600 A see page A-14 to A-17.

- Disconnected position - the power circuits are disconnected, but the circuit breaker is still on the chassis and may still be operated (ON, OFF, push-to-trip).
- The circuit breaker may be locked using 1 to 3 padlocks (shackle diameter 5 to 8 mm), to prevent connection.
- The auxiliaries can be tested (with manual auxiliary connector).

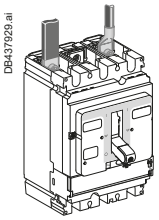
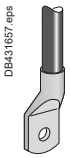
Electrical and Mechanical Accessories
Connection of Fixed Devices

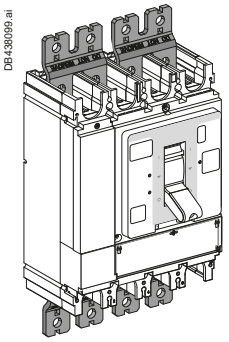
Fixed circuit breakers are designed for standard front connection using bars or cables with lugs.
Cable connectors are available for bare cables. Rear connection is also possible.

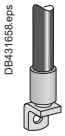


Insulated bar

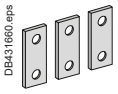


Small lug for copper cables

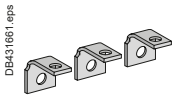




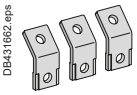
Small lug for Al cables



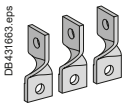
Straight terminal extensions



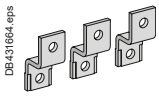
Right-angle terminal extensions



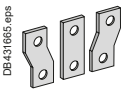
45° terminal extensions



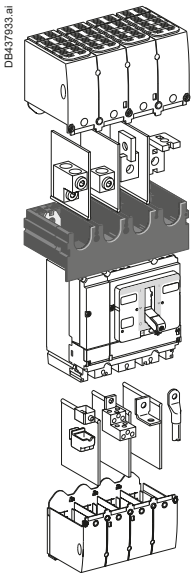
Edgewise terminal extensions

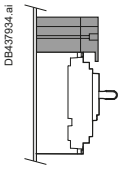


Double-L terminal extensions

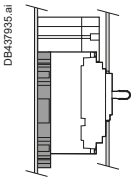


Spreaders





Mounting at the back of a switchboard



Mounting behind the front panel with a raiser

Front Connection

Bars or Cables with Lugs

Standard terminals
ComPacT NSX100 to 630 DC come with terminals comprising snap-in nuts with screws:
- ComPacT NSX100/160/250 DC: M8 nuts and screws
- ComPacT NSX400/630 DC: M10 nuts and screws.

These terminals may be used for:
- Direct connection of insulated bars or cables with lugs
- Terminal extensions offering a wide range of connection possibilities.

Interphase barriers or terminal shields are recommended. They are mandatory for certain connection accessories (in which case the interphase barriers are provided).

Bars
When the switchboard configuration has not been tested, insulated bars are mandatory.

Maximum size of bars

ComPacT NSX DC circuit breaker		100 to 250	400 to 630	1200
Without spreaders	pitch (mm)	35	45	45
	maximum bar size (mm)	20 x 2	32 x 6	2 x (32 x 6)
With spreaders	pitch (mm)	45	52.5	-
	maximum bar size (mm)	32 x 2	40 x 6	-

Crimp lugs
There are two models, for aluminium and copper cables.
It is necessary to use narrow lugs, compatible with device connections. They must be used with interphase barriers or long terminal shields. The lugs are supplied with interphase barriers and may be used for the types of cables listed below.

Cable sizes for connection using lugs

ComPacT NSX DC circuit breaker		100 to 250	400 to 630	630 to 1200
Copper cables	size (mm²)	120, 150, 185	240, 300	185, 2 x 185
	crimping	hexagonal barrels or punching		
Aluminium cables	size (mm²)	120, 150, 185	240, 300	185, 2 x 185
	crimping	hexagonal barrels		

Terminal extensions
Extensions with anti-rotation ribs can be attached to the standard terminals to provide numerous connection possibilities in little space:
- Straight terminal extensions
- Right-angle terminal extensions
- Edgewise terminal extensions
- Double-L extensions
- 45° extensions.

Spreaders
Spreaders may be used to increase the pitch:
- NSX100 to 250 DC: the 35 mm pitch can be increased to 45 mm
- NSX400/630 DC: the 45 mm pitch can be increased to 52 or 70 mm.

Bars, cable lugs or cable connectors can be attached to the ends.

One-piece spreader for NSX100 to 250 DC
Connection of large cables may require an increase in the distance between the device terminals.
The one-piece spreader is the means to:
- Increase the 35 mm pitch of the NSX100 to 250 DC circuit breaker terminals to the 45 mm pitch of a NSX400/630 DC device
- Use all the connection and insulation accessories available for the next largest frame size (lugs, connectors, spreaders, right-angle and edgewise terminal extensions, terminal shields and interphase barriers).

It may also be used for ComPacT INS switch-disconnectors.
Equipped with a single-piece spreader, ComPacT NSX DC devices can be mounted:
- At the back of a switchboard
- Behind the front panel with a raiser.

The one-piece spreader is also the means to:
- Align devices with different frame sizes in the switchboard
- Use the same mounting plate, whatever the device.

Pitch (mm) depending on the type of spreader

ComPacT NSX DC circuit breaker	100 to 250	400 to 630
Without spreaders	35	45
With spreaders	45	52.5 or 70
With one-piece spreader	45	-

Bare Cables

For bare cables (without lugs), the prefabricated bare-cable connectors may be used for both copper and aluminium cables.

1-cable connector for ComPacT NSX100 to 250 DC
The connectors snap directly on to the device terminals and are fixed by clips to right-angle and straight terminal extensions as well as spreaders.

1-cable connector for ComPacT NSX400 to 630 DC
The connectors are screwed directly to the device terminals.

2-cable connector for ComPacT NSX100 to 250 and 400/630/1200 DC
The connectors are screwed to device terminals or right-angle terminal extensions.

Distribution connectors for ComPacT NSX100 to 250 DC
These connectors are screwed directly to device terminals. Interphase barriers are supplied with distribution connectors, but may be replaced by long terminal shields. Each connector can receive six cables with cross-sectional areas ranging from 1.5 to 35 mm² each.

Maximum size of cables depending on the type of connector

ComPacT NSX DC circuit breaker		100/160	250	400	630	1200
Steel connectors	1.5 to 95 mm²	◉				
Aluminium connectors	25 to 95 mm²	◉	◉			
	120 to 185 mm²	◉	◉			
	2 cables 50 to 120 mm²	◉	◉

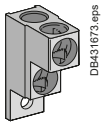
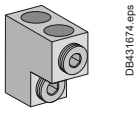
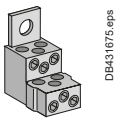
1-cable connector for NSX400/ 630 DC



2-cable connector for NSX100 to 250 DC



2-cable connector for NSX400/ 630/1200 DC



Distribution connector for NSX100 to 250 DC

Rear Connection (up to Rated Current 600 A)

Device mounting on a backplate with suitable holes enables rear connection.

Bars or Cables with Lugs

Rear connections for bars or cables with lugs are available in two lengths. Bars may be positioned flat, on edge or at 45° angles depending on how the rear connections are positioned.
The rear connections are simply fitted to the device connection terminals. All combinations of rear connection lengths and positions are possible on a given device.

Bare Cables

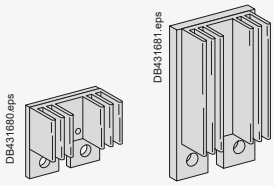
For the connection of bare cables, the 1-cable connectors for ComPacT NSX100 to 250 DC may be secured to the rear connections using clips.

Accessories for Series and Parallel Connection (up to Rated Current 600 A)

A limited number of accessories can be used to optimize series and parallel connection of poles.

Accessories for Series Connection

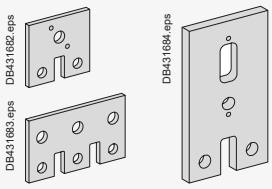
These include series connection plates, equipped with heat sinks.



Series connection plates equipped with heat sinks

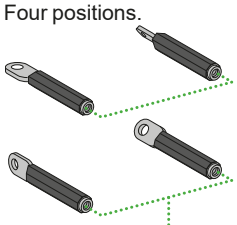
Accessories for Parallel Connection

Parallel pole connection accessories are identical to those for series connections. They are equipped with heat sinks. Customer connections are made directly to the connection plates after removing the heat sinks.



Parallel connection plates

Four positions.



Two lengths.

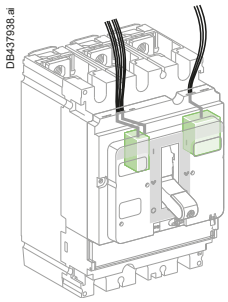
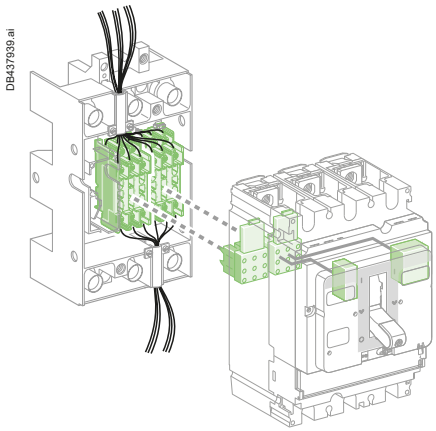
Connection of Electrical Auxiliaries



Fixed ComPacT NSX DC



Plug-in/withdrawable
ComPacT NSX DC

Fixed ComPacT NSX100-250 DC

Auxiliary circuits exit the device through a knock-out in the front cover.

Withdrawable or Plug-in ComPacT NSX DC

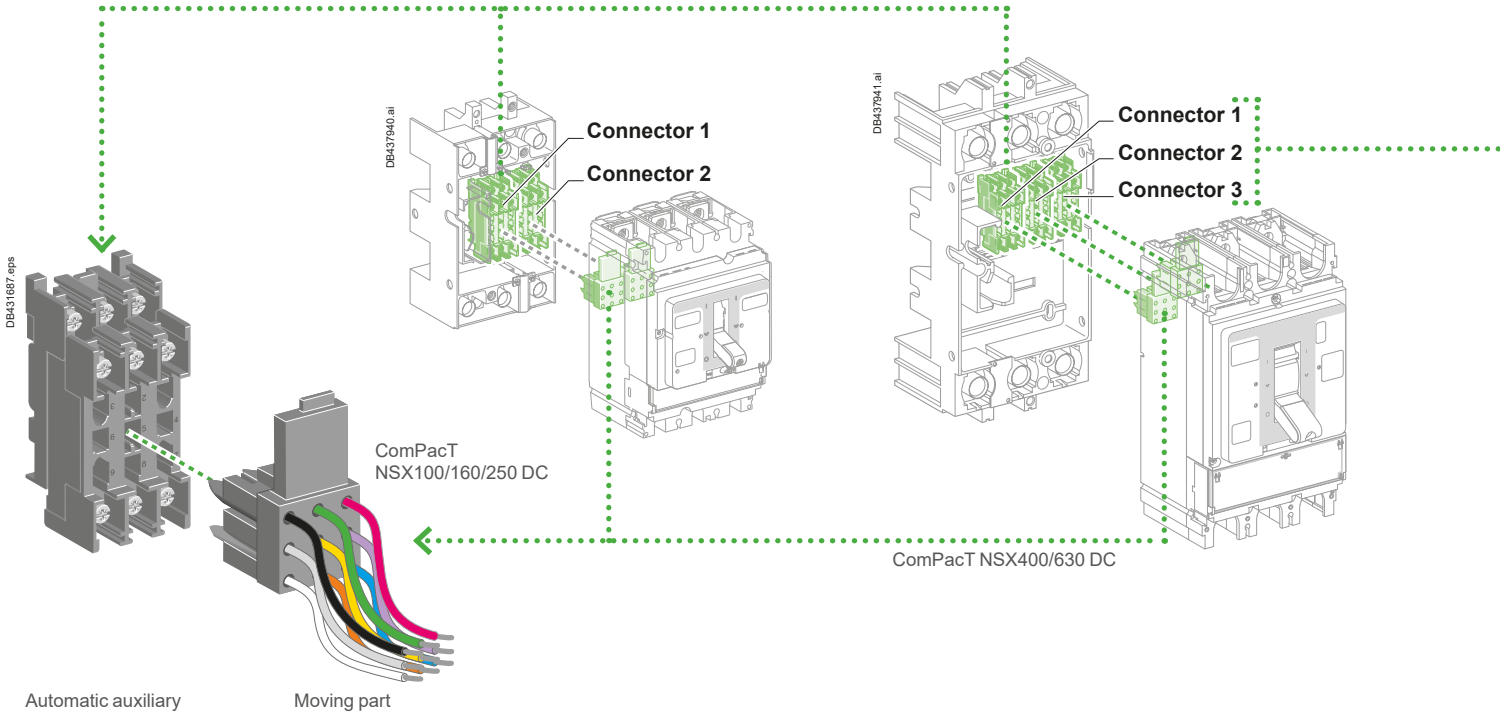
Automatic Auxiliary Connectors

Auxiliary circuits exit the circuit breaker via one to three automatic auxiliary connectors (nine wires each). These are made up of:

- A moving part, connected to the circuit breaker via a support (one support per circuit breaker)
- A fixed part, mounted on the plug-in base, equipped with connectors for bare cables up to 2.5 mm².

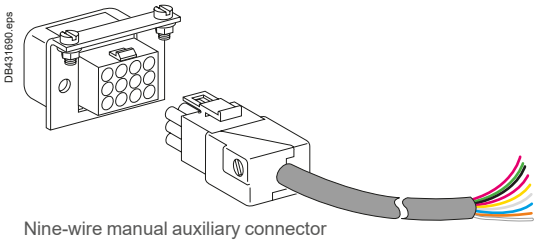
MicroLogic trip unit options are also wired via the automatic auxiliary connectors.

Selection of automatic auxiliary connectors
Depending on the functions installed, one to three automatic auxiliary connectors are required.



Automatic auxiliary connector: Fixed part

Moving part

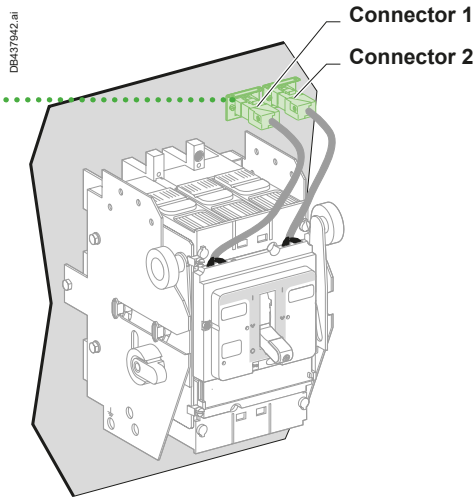


Nine-wire manual auxiliary connector

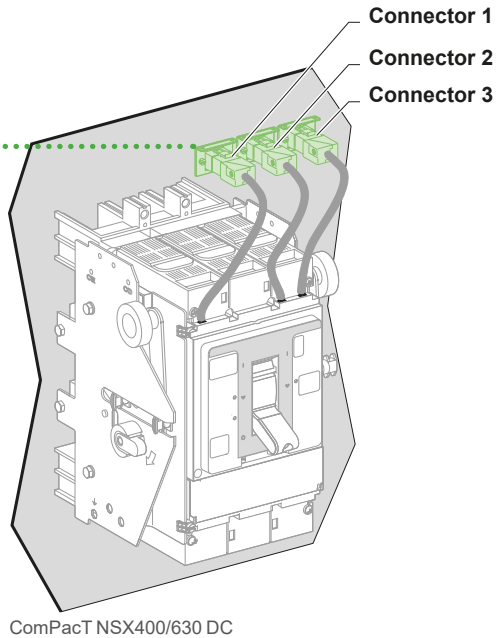
Withdrawable ComPacT NSX DC

Manual Auxiliary Connectors

As an option to the automatic auxiliary connectors, withdrawable circuit breakers may be equipped with one to three plugs with nine wires each. In "disconnected" position, the auxiliaries remain connected.
They can then be tested by operating the device.



ComPacT NSX100/160/250 DC



ComPacT NSX400/630 DC

Each auxiliary is equipped with a terminal block with numbered terminals for connection of wires up to:
- 1.5 mm² for auxiliary contacts and voltage releases
- 2.5 mm² for the motor mechanism module.

Selection of Auxiliaries for ComPacT NSX100/160/250 DC

PB120468.eps

Remote Tripping

MX or MN voltage releases are used to trip the circuit breaker.

MN Undervoltage Release

This release trips the circuit breaker when the control voltage drops below a tripping threshold:

- Tripping threshold between 0.35 and 0.7 times the rated voltage.
- Circuit breaker closing is possible if the voltage exceeds 0.85 times the rated voltage. For a lower value, circuit breaker closing cannot be ensured.

Circuit breaker tripping by an MN release meets the requirements of standard IEC 60947-2.

Time-Delay Unit for an MN Release

Eliminates nuisance tripping due to transient voltage dips lasting 200 ms.
It is used in conjunction with:

- A 250 V DC MN release, control voltage 220/240 V AC
- A 48 V DC MN release, control voltage 48 V AC.

MX Shunt Release

Trips the circuit breaker when the control voltage rises above 0.7 x Un.
Control signals can be of the impulse type (≥ 20 ms) or maintained.

Operation

When the circuit breaker has been tripped by an MN or MX release, it must be reset locally.
MN or MX tripping takes priority over manual closing.
In the presence of a standing trip order, closing of the contacts, even temporary, is not possible.

Mechanical Characteristics

- Endurance is equal to 50 % of the mechanical endurance of the circuit breaker.
- The releases clip in behind the front cover.
- Connection using wires up to 1.5 mm², to integrated terminal blocks.

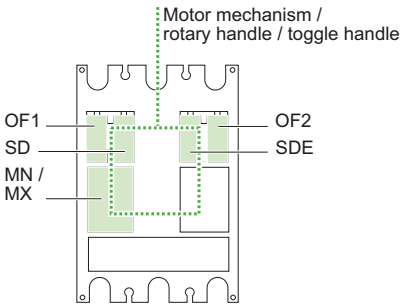
Electrical Characteristics

- Consumption:
  - Pick-up (MX): < 30 VA
  - Seal-in (MN and MNR): < 5 VA.
- Response time: < 50 ms.

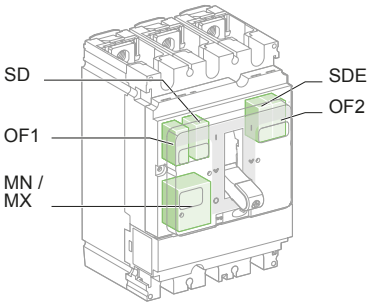
NA, TMD, TMG

Standard

DB431693.eps



DB437944.ai



Communication

Communication requires specific auxiliaries (see page A-42).

Communication of status indications [1]

- 1 BSCM module.
- 1 NSX cord (internal terminal block) for both communication and 24 V DC supply to the BSCM.

Communication of status conditions is compatible with a toggle handle and a rotary handle.

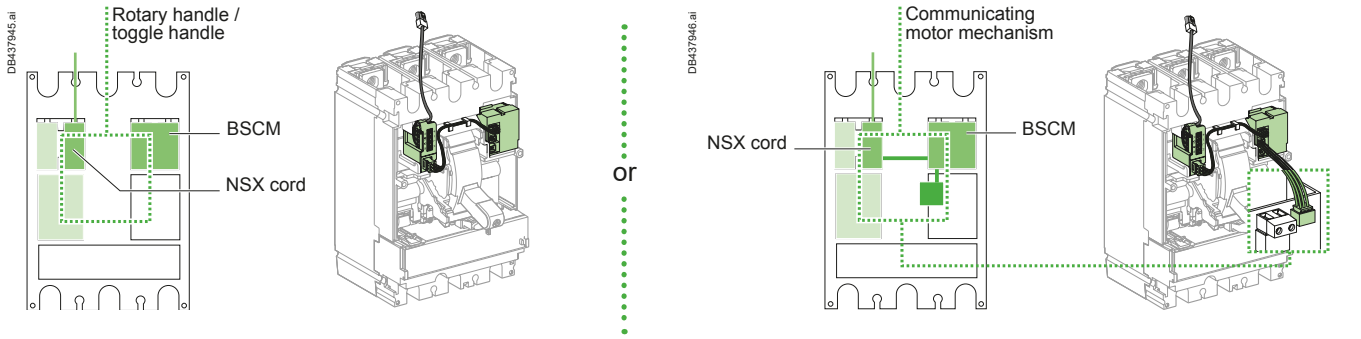
Communication of status indications and controls

This requires, in addition to the previous auxiliaries:

- 1 IFM connected to the BSCM.

TMD, TMG

Communication of status indications [1]



[1] ComPacT NSX100-250 DC only.

Electrical and Mechanical Accessories
Selection of Auxiliaries for ComPacT NSX400/630/1200 DC

A

Standard

All ComPacT NSX400/630/1200 DC circuit breakers and switch-disconnectors have slots for the electrical auxiliaries listed below.

5 indication contacts (see page A-39)
- 3 ON/OFF (OF1, OF2, OF3)
- 1 trip indication (SD)
- 1 fault-trip indication (SDE)

1 remote-tripping release (see page A-43)
- Either 1 MN undervoltage release
- Or 1 MX shunt release

All these auxiliaries may be installed with a motor mechanism or a rotary handle or toggle handle.

Indication Contacts for ComPacT NSX DC

One contact model provides circuit breaker status indications (OF - SD - SDE).
An early-make or early-break contact, in conjunction with a rotary handle, can be used to anticipate device opening or closing.
A CE/CD contact indicates that the chassis is connected/disconnected.

These common-point changeover contacts provide remote circuit breaker status information.
They can be used for indications, electrical locking, relaying, etc.
They comply with the IEC 60947-5 international recommendation.

Functions

Breaker-status indications, during normal operation or after a fault
A single type of contact provides all the different indication functions:
- OF (ON/OFF) indicates the position of the circuit breaker contacts
- SD (trip indication) indicates that the circuit breaker has tripped due to:
  - An overload
  - A short-circuit
  - Operation of a voltage release
  - Operation of the "push to trip" button
  - Disconnection when the device is ON.

The SD contact returns to de-energized state when the circuit breaker is reset.
- SDE (fault-trip indication) indicates that the circuit breaker has tripped due to:
  - An overload
  - A short-circuit.

The SD contact returns to de-energized state when the circuit breaker is reset.

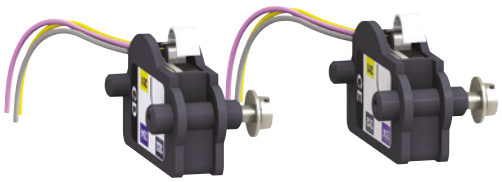
Rotary-handle position contact for early-make or early-break functions
- CAM (early-make or early-break function) contacts indicate the position of the rotary handle.

They are used in particular for advanced opening of safety trip devices (early break) or to energize a control device prior to circuit breaker closing (early make).

Chassis-position contacts
- CE/CD (connected/disconnected) contacts are microswitch-type carriage switches for withdrawable circuit breakers.

LV429454.eps

Indication contacts



PB103706-68.eps

CE/CD carriage switches

Installation

- OF, SD, SDE functions: a single type of contact provides all these different indication functions, depending on where it is inserted in the device. The contacts clip into slots behind the front cover of the circuit breaker.

The SDE function on a ComPacT NSX100 - 250 DC equipped with a thermal-magnetic trip unit requires the SDE actuator.
- CAM function: the contact fits into the rotary-handle unit (direct or extended).
- CE/CD function: the contacts clip into the fixed part of the chassis.

Electrical Characteristics of Auxiliary Contacts

Contacts			Standard				Low level

Electrical and Mechanical Accessories
Rotary Handles for ComPacT NSX DC

There are two types of rotary handle:
- Direct rotary handle
- Extended rotary handle.

There are two models:
- Standard with a black handle
- Red handle and yellow front for machine-tool control.

PB104936.eps

ComPacT NSX DC with a rotary handle

PB103607-50.eps

ComPacT NSX DC with an MCC rotary handle

PB103608-50.eps

ComPacT NSX DC with a CNOMO machine-tool rotary handle

Direct Rotary Handle

Standard Handle

Degree of protection IP40, IK07.
The direct rotary handle maintains:
- Visibility of and access to trip unit settings
- Suitability for isolation
- Indication of the three positions O (OFF), I (ON) and tripped
- Access to the "push to trip" button.

Device locking
The rotary handle facilitates circuit breaker locking.
- Padlocking:
  - Standard situation, in the OFF position, using 1 to 3 padlocks, shackle diameter 5 to 8 mm, not supplied
  - With a simple modification, in the ON and OFF positions. Locking in the ON position does not prevent free circuit breaker tripping if a fault occurs. In this case, the handle remains the ON position after the circuit breaker tripping. Unlocking is required to go to the tripped then the OFF position.
- Keylock (and padlock).

It is possible to install a Ronis or Profalux keylock (optional) on the base of the handle to obtain the same functions as with a padlock.

Early-make or early-break contacts (optional)
Early-make and/or early-break contacts may be used with the rotary handle. It is thus possible to:
- Supply an MN undervoltage release before the circuit breaker closes
- Open the contactor control circuit before the circuit breaker opens.

MCC Switchboard Control

Control of an MCC switchboard is achieved by adding a kit to the standard handle. In addition to the standard functions, the kit offers the characteristics listed below.

Higher degree of protection IP
Degree of protection IP43, IK07.
The IP is increased by a built-in gasket.

Door locking depending on device position
- The door cannot be opened if the circuit breaker is ON or in the tripped position. For exceptional situations, door locking can be temporarily disabled with a tool to open the door when the circuit breaker is closed. This operation is not possible if the handle is locked by a padlock.
- Circuit breaker closing is disabled if the door is open. This function can be deactivated.

Machine-Tool Control in Compliance with CNOMO

Control of a machine-tool is achieved by adding a kit to the standard handle. In addition to the standard functions, the kit offers the characteristics listed below.

Enhanced waterproofness and mechanical protection
- Degree of protection IP54, IK08.
- Compliance with CNOMO E03.81.501N.

Electrical and Mechanical Accessories
Rotary Handles for ComPacT NSX DC

Extended Rotary Handle

Degree of protection IP55, IK08.
The extended rotary handle makes it possible to operate circuit breakers installed at the back of switchboards, from the switchboard front.
It maintains:
- Visibility of and access to trip unit settings
- Suitability for isolation
- Indication of the three positions O (OFF), I (ON) and tripped.

Mechanical door locking when device closed
A standard feature of the extended rotary handle is a locking function, built into the shaft, that disables door opening when the circuit breaker is in the ON or tripped positions.
Door locking can be temporarily disabled with a tool to open the door without opening the circuit breaker. This operation is not possible if the handle is locked by a padlock.

Voluntary disabling of mechanical door locking
A modification to the handle, that can be carried out on site, completely disables door locking, including when a padlock is installed on the handle. The modification is reversible.

When a number of extended rotary handles are installed on a door, this disabling function is the means to ensure door locking by a single device.

Device and door padlocking
Padlocking locks the circuit breaker handle and disables door opening:
- Standard situation, in the OFF position, using 1 to 3 padlocks, shackle diameter 5 to 8 mm, not supplied
- With a simple modification, in the ON and OFF positions. Locking in the ON position does not prevent free circuit breaker tripping if a fault occurs.

In this case, the handle remains in the ON position after the circuit breaker tripping. Unlocking is required to go to the tripped then the OFF position.
If the door controls were modified to voluntarily disable door locking, padlocking does not lock the door, but does disable handle operation of the device.

Device locking using a keylock inside the switchboard
It is possible to install a Ronis or Profalux keylock (optional) on the base of the rotary handle to lock the device in the OFF position or in either the ON or OFF positions.

Accessory for device operation with the door open
When the device is equipped with an extended rotary handle, a control accessory mounted on the shaft makes it possible to operate the device with the door open.
- The device can be padlocked in the OFF position.
- The accessory complies with UL508.

Early-make or early-break contacts (optional)
The extended rotary handle offers the same possibilities with early-make and/or early-break contacts as the standard rotary handle.

Parts of the extended rotary handles
- A unit that replaces the front cover of the circuit breaker (secured by screws).
- An assembly (handle and front plate) on the door that is always secured in the same position, whether the circuit breaker is installed vertically or horizontally.
- An extension shaft that must be adjusted to the distance. The min/max distance between the back of circuit breaker and door is:
  - 185…600 mm for ComPacT NSX100 to 250 DC
  - 209…600 mm for ComPacT NSX400/630/1200 DC.

For withdrawable devices, the extended rotary handle is also available with a telescopic shaft to compensate for device disconnection. In this case, the min/max distances are:
- 248…600 mm for ComPacT NSX100 to 250 DC
- 272...600 mm for ComPacT NSX400/630/1200 DC.

Manual Source-Changeover Systems

An additional accessory interlocks two devices with rotary handles to create a source-changeover system. Closing of one device is possible only if the second is open.
This function is compatible with direct or extended rotary handles.
Up to three padlocks can be used to lock in the OFF or ON position.

Motor Mechanism for ComPacT NSX DC

PB113341.eps

ComPacT NSX250 DC with motor mechanism

When equipped with a **motor mechanism** module, ComPacT NSX DC circuit breakers feature very high mechanical endurance as well as easy and reliable operation:
- All circuit breaker indications and information remain visible and accessible, including trip unit settings and indications
- Suitability for isolation is maintained and padlocking remains possible
- Double insulation of the front face.

A specific motor mechanism is required for operation via the communication function [1]. This **communicating motor mechanism** must be connected to the BSCM module to receive the opening and closing orders. Operation is identical to that of a standard motor mechanism.

Applications
- Local motor-driven operation, centralized operation, automatic distribution control.
- Normal/standby source changeover or switching to a replacement source For availability and energy cost optimization.
- Load shedding and reconnection.
- Synchrocoupling.

Operation
The type of operation is selected using the manual/auto mode selection switch (**7**). A transparent, lead-seal cover controls access to the switch.

Automatic

When the switch is in the "auto" position, the ON/OFF (I/O) buttons and the charging lever on the mechanism are locked.
- Circuit breaker ON and OFF controlled by two impulse-type or maintained signals.
- Automatic spring charging following voluntary tripping (by MN or MX), with standard wiring.
- Mandatory manual reset following tripping due to an electrical fault.

Manual

When the switch is in the "manual" position, the ON/OFF (I/O) buttons may be used. A microswitch linked to the manual position can remote the information.
- Circuit breaker ON and OFF controlled by 2 pushbuttons I/O.
- Recharging of stored-energy system by pumping the lever 8 times.
- Padlocking in OFF position.

Installation and Connections
All installation (fixed, plug-in/withdrawable) and connection possibilities are maintained.

Motor mechanism module connections are made behind its front cover to integrated terminals, for cables up to 2.5 mm².

Optional Accessories
- Keylock for locking in OFF position.
- Operations counter for the ComPacT NSX400/630 DC, indicating the number of ON/OFF cycles. Must be installed on the front of the motor mechanism module.

Electrical and Mechanical Accessories
Remote Tripping for ComPacT NSX DC

MX or MN voltage releases are used to trip the circuit breaker. They serve primarily for remote, emergency-off commands.
It is advised to test the system every six months.

MN Undervoltage Release

The MN release opens the circuit breaker when its supply voltage drops to a value below 35 % of its rated voltage Un.
Undervoltage tripping, combined with an emergency-off button, provides fail-safe tripping. The MN release is continuously supplied, i.e. if supply is interrupted:

- Either voluntarily, by the emergency-off button
- Or accidentally, through loss of power or faulty wiring, the release provokes opening of the circuit breaker.

Opening conditions

Circuit breaker tripping by an MN release meets the requirements of standard IEC 60947-2.

- Automatic opening of the circuit breaker is ensured when the continuous voltage supply to the release U ⩽ 0.35 x Un.
- If the supply voltage is between 0.35 and 0.7 Un, opening is possible, but not guaranteed. Above 0.7 Un, opening does not take place.

Closing conditions

If there is no supply to the MN release, it is impossible to close the circuit breaker, either manually or electrically. Closing is ensured when the voltage supply to the release U ⩾ 0.85 x Un. Below this threshold, closing is not ensured.

Characteristics

Power supply	V AC	50/60 Hz: 24 - 48 - 100/130 - 200/240
		50 Hz: 380/415 60 Hz: 208/277
	V DC	12 - 24 - 30 - 48 - 60 - 125 -250
Operating threshold	Opening	0.35 to 0.7 Un
	Closing	0.85 Un
Operating range		0.85 to 1.1 Un
Consumption (VA or W)		Pick-up: 10 - Hold: 5
Response time (ms)		50

Time-delay unit for an MN release

A time delay unit for the MN release eliminates the risk of nuisance tripping due to a transient voltage dip. For shorter micro-outages, a system of capacitors provides temporary supply to the MN at U > 0.7 to ensure non tripping.
The correspondence between MN releases and time-delay units is shown below.

Power supply	Corresponding MN release
Unit with fixed delay 200 ms	
48 V AC	48 V DC
220/240 V AC	250 V DC
Unit with adjustable delay ⩾ 200 ms	
48 - 60 V AC/DC	48 V DC
100 - 130 V AC/DC	125 V DC
220 - 250 V AC/DC	250 V DC

MX Shunt Release

The MX release opens the circuit breaker via an impulse-type (⩾ 20 ms) or maintained order.

Opening conditions

When the MX release is supplied, it automatically opens the circuit breaker. Opening is ensured for a voltage U ⩾ 0.7 x Un.

Characteristics

Power supply	V AC	50/60 Hz: 24 - 48 - 100/130 - 200/240
		50 Hz: 380/415 60 Hz: 208/277
	V DC	12 - 24 - 30 - 48 - 60 - 125 -250
Operating range		0.7 to 1.1 Un
Consumption (VA or W)		Pick-up: 10
Response time (ms)		50

Circuit Breaker Control by MN or MX

When the circuit breaker has been tripped by an MN or MX release, it must be reset before it can be reclosed.
MN or MX tripping takes priority over manual closing.
In the presence of a standing trip order, closing of the contacts, even temporary, is not possible.
Connection using wires up to 1.5 mm² to integrated terminal blocks.

Electrical and Mechanical Accessories
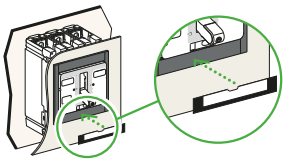
Sealing Accessories for ComPacT NSX DC

Outgoing-Circuit Identification

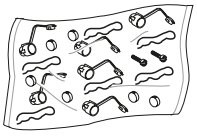
ComPacT NSX100 to 630 DC can be equipped with label holders supplied in sets of ten (cat. no. LV429226).
They are compatible with escutcheons.



Identification accessories

Sealing Accessories

Sealing accessories are available. Each bag of accessories contains all the parts required for the types of sealing indicated below.
A bag contains:
- 6 sealing accessories
- 6 lead seals
- 0.5 m of wire
- 2 screws.



Sealing accessories

A

Types of Seals and Corresponding Functions

Toggle control				Rotary handle				Motor mechanism				Types of seals	**Front-cover fixing screw**	**Trip unit transparent cover**	**Motor mechanism transparent cover**	**Terminal-shield fixing screw**
Protected operations	■ Front removal ■ Access to auxiliaries ■ Trip unit removal.	■ Modification of settings ■ Access to test connector.	■ access to manual/auto mode selection switch: depending on its position, manual [1] or automatic operation is not possible. [1] In this case, local operation is not possible.	■ access to power connections (protection against direct contact).

Electrical and Mechanical Accessories

Escutcheons and Protection Collars for ComPacT NSX DC

Escutcheons are an optional feature mounted on the switchboard door. They increase the degree of protection to IP40, IK07. Protection collars maintain the degree of protection, whatever the position of the device (connected, disconnected).

A

PB104942.eps

IP30 escutcheon

PB104938.eps

IP30 escutcheon with access to the trip unit

IP30 or IP40 Escutcheons for Fixed Devices

IP30

The three types are glued to the cut-out in the front door of the switchboard:

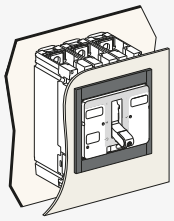
- Escutcheon for all control types (toggle, rotary handle or motor mechanism):
  - Without access to the trip unit
  - With access to the trip unit.

IP40

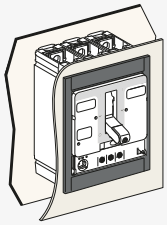
The four types, with a gasket, are screwed to the door cut-out:

- Three escutcheons identical to the previous, but IP40
- A wide model for Vigi module that can be combined with the above.

DB437964.ai



DB437965.ai



Escutcheon for toggle without and with access to the trip unit

A

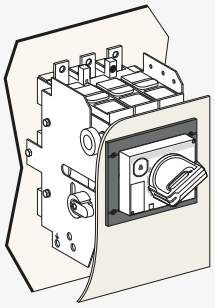
IP40 Escutcheons for Withdrawable Devices

IP40 for Withdrawable Devices

The two types, with a gasket, are screwed to the door cut-out:

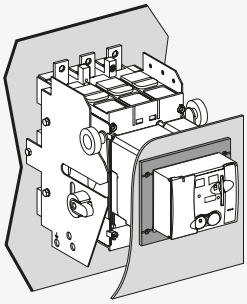
- For rotary handle or motor mechanism: standard IP40 escutcheon
- For toggle with extension: standard escutcheon + collar for withdrawal.

DB437966.ai



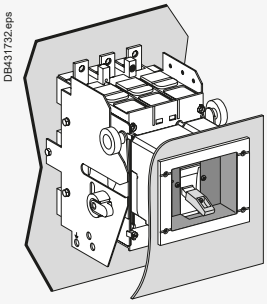
Standard escutcheon with rotary handle

DB431731.eps



Standard escutcheon for motor mechanism

DB431732.eps



Standard escutcheon with collar for withdrawal, for toggle

IP43 Toggle Cover

Available only for devices with toggles. Fits over toggle and front cover of the device.

- Mounted on the front of the circuit breaker.
- Degree of protection IP43, IK07.

DB112218.eps

Toggle cover

Retrofit Front Covers

These replacement front covers make it possible to install NSX DC devices in existing switchboards containing NSX devices by installing the NSX-type retrofit covers on the NSX DC devices.

- NSX100 to 250 DC cover.
- NSX400/630 DC cover.

TransferPacT Source-Changeover Systems
Presentation

PB191613-50.eps

Some installations use two supply sources to counter the temporary loss of the main supply.
A source-changeover system is required to safely switch between the two sources.
The replacement source can be a generator set or another network.

Manual Source-Changeover System or MTSE (Manual Transfer Switching Equipment)

The simplest way to switch the load. It is controlled manually by an operator.
The time required to switch from the S1 source to S2 source is variable.

System

2 or 3 mechanically interlocked circuit breakers or 2 switch-disconnectors.

Applications

Small commercial buildings and small and medium industrial activities where the need for continuity of service is significant but not a priority.

65587-117.eps

Automatic Source-Changeover System or ATSE (Automatic Transfer Switching Equipment)

An automatic controller may be added to a remote operated source-changeover system. It is possible to automatically control source transfer according to programmed (dedicated controllers) or programmable (PLC) operating modes. These solutions ensure optimum energy management.
The time required to switch from the S1 source to S2 source is fixed.

System

2 or 3 circuit breakers linked by an electrical interlocking system. A mechanical interlocking system protects also against incorrect manual operations, with an automatic control system (dedicated controllers).

Applications

Large infrastructures, industry, critical buildings & process where the continuity of service is a priority.

> TransferPacT
(Source-changeover systems)
LVPED216028EN

Interlocking of Two or Three Toggle-Controlled Devices

Interlocking system

Two devices can be interlocked using this system. Two identical interlocking systems can be used to interlock three devices installed side by side.

Authorized positions:

- One device closed (ON), the others open (OFF)
- All devices open (OFF).

The system is locked using one or two padlocks (shackle diameter 5 to 8 mm).

This system can be expanded to more than three devices.

There are two interlocking-system models:

- One for ComPacT INS/INV
- One for ComPacT NSX100 to NSX250
- One for ComPacT NSX400 to NSX630.

Combinations of Normal and Replacement devices

All toggle-controlled fixed or plug-in ComPacT NSX100 to NSX630 circuit breakers and switch-disconnectors of the same frame size can be interlocked. The devices must be either all fixed or all plug-in versions.

PB113435.eps

Interlocking of two or three toggle-controlled devices

Interlocking of Two Devices with Rotary Handles

Interlocking system

Interlocking involves padlocking the rotary handles on two devices which may be either circuit breakers or switch-disconnectors.

Authorized positions:

- One device closed (ON), the other open (OFF)
- Both devices open (OFF).

The system is locked using up to three padlocks (shackle diameter 5 to 8 mm).

There are two interlocking-system models:

- One for ComPacT INS/INV
- One for ComPacT NSX100 to NSX250
- One for ComPacT NSX400 to NSX630.

Combinations of Normal and Replacement devices

All rotary-handle fixed or plug-in ComPacT NSX100 to NSX630 circuit breakers and switch-disconnectors of the same frame size can be interlocked. The devices must be either all fixed or all plug-in versions.

PB113418.eps

Interlocking of two devices with rotary handles

Interlocking of Two Devices on a Base Plate

Interlocking system

A base plate designed for two ComPacT NSX devices can be installed horizontally or vertically on a mounting rail. Interlocking is carried out on the base plate by a mechanism located behind the devices. In this way, access to the device controls and trip units is not blocked.

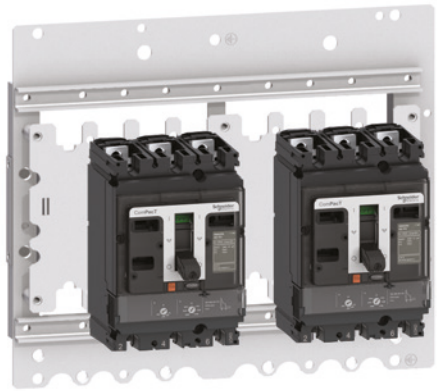
Combinations of Normal and Replacement devices

All rotary-handle and toggle-controlled ComPacT NSX100 to NSX630 circuit breakers and switch-disconnectors can be interlocked. Devices must be either all fixed or all plug-in versions, with or without earth-leakage protection or measurement modules.

An adaptation kit is required to interlock:

- Two plug-in devices
- A ComPacT NSX100 to NSX250 with an NSX400 to NSX630.

Connection to the downstream installation can be made easier using a coupling accessory (see next page).



PB113417.eps

Interlocking on a base plate

Interlocking of a Number of Devices Using Keylocks (Captive Keys)

Interlocking using keylocks is very simple and makes it possible to interlock two or more devices that are physically distant or that have very different characteristics, for example medium-voltage and low-voltage devices or a ComPacT NSX100 to NSX630 switch-disconnector.

Interlocking system

Each device is equipped with an identical keylock and the key is captive on the closed (ON) device. A single key is available for all devices. It is necessary to first open (OFF position) the device with the key before the key can be withdrawn and used to close another device.

A system of wall-mounted captive key boxes makes a large number of combinations possible between many devices.

Combinations of Normal and Replacement devices

All rotary-handle ComPacT NSX100 to NSX630 circuit breakers and switch-disconnectors can be interlocked between each other or with any other device equipped with the same type of keylock.

[1] Double earth fault:
PV systems are either insulated from the earth or one pole is earthed through an overcurrent protection. In both set-ups, therefore, there can be a ground fault in which current leaks to the ground. If this fault is not cleared, it may spread to the healthy pole and give rise to a hazardous situation where fire could break out. Even though double insulation makes such an eventuality unlikely, it deserves full attention.
For the two following reasons the double fault situation shall be absolutely avoided: insulation monitoring devices or overcurrent protection in earthed system shall detect first fault and staff shall look after the first fault and clear it with no delay.

- The fault level could be low (e.g. two insulation faults or a low short-circuit capability of the generator in weak sunlight) and below the tripping value of overcurrent protection (circuit breaker or fuses). However, a DC arc fault does not extinguish itself, even when the current is low. It could be a serious hazard, particularly for PV modules on buildings.
- Circuit breakers and switches used in PV systems are designed to break the rated current or fault current with all poles at open-circuit maximum voltage ($U_{OC\,MAX}$). To break the current when $U_{OC\,MAX}$ is equal to 1000 V, four poles in series (two poles in series for each polarity) are required. In double earth fault situations, the circuit breaker or switches must break the current at full voltage with only two poles in series. Such switchgear is not designed for that purpose and could sustain irremediable damage if used to break the current in a double ground fault situation.

The ideal solution is to prevent double ground faults arising. Insulation monitoring devices or overcurrent protection in grounded systems detect the first fault. However, although the insulation fault monitoring system usually stops the inverter, the fault is still present. Staff must locate and clear it without delay. In large generators with sub-arrays protected by circuit breakers, it is highly advisable to disconnect each array when that first fault has been detected but not cleared within the next few hours.

[1] Double earth fault:
PV systems are either insulated from the earth or one pole is earthed through an overcurrent protection. In both set-ups, therefore, there can be a ground fault in which current leaks to the ground. If this fault is not cleared, it may spread to the healthy pole and give rise to a hazardous situation where fire could break out. Even though double insulation makes such an eventuality unlikely, it deserves full attention.
For the two following reasons the double fault situation shall be absolutely avoided: insulation monitoring devices or overcurrent protection in earthed system shall detect first fault and staff shall look after the first fault and clear it with no delay.

- The fault level could be low (e.g. two insulation faults or a low short-circuit capability of the generator in weak sunlight) and below the tripping value of overcurrent protection (circuit breaker or fuses). However, a DC arc fault does not extinguish itself, even when the current is low. It could be a serious hazard, particularly for PV modules on buildings.
- Circuit breakers and switches used in PV systems are designed to break the rated current or fault current with all poles at open-circuit maximum voltage ($U_{OC\,MAX}$). To break the current when $U_{OC\,MAX}$ is equal to 1000 V, four poles in series (two poles in series for each polarity) are required. In double earth fault situations, the circuit breaker or switches must break the current at full voltage with only two poles in series. Such switchgear is not designed for that purpose and could sustain irremediable damage if used to break the current in a double ground fault situation.

The ideal solution is to prevent double ground faults arising. Insulation monitoring devices or overcurrent protection in grounded systems detect the first fault. However, although the insulation fault monitoring system usually stops the inverter, the fault is still present. Staff must locate and clear it without delay. In large generators with sub-arrays protected by circuit breakers, it is highly advisable to disconnect each array when that first fault has been detected but not cleared within the next few hours.

ComPacT INS PV-1

No matter the size or scale of the project, Schneider Electric, has a photovoltaic solution to fit your needs. Fast ROI, high efficiency – it's all a part of our offer as the world leader in energy management.

The INS PV-1 is a direct current switch disconnector dedicated to array isolation and control with Voc until 600 V DC.

Switch-Disconnector Selection
ComPacT INS250-100 to 630 DC

ComPacT INS switch-disconnectors

Installation

Fixed, front connection	
Fixed, rear connection	
On symmetrical rails	
On a backplate	

Connection

By cables	To bare cable connectors
By cables with lugs	Directly to terminals
	To spreaders
	To vertical-connection adapters via cable-lug adapters
Flat-facing bars	Directly to terminals
	To spreaders
Edgewise bars	To vertical-connection adapters
Indication and measurement auxiliaries	
Auxiliary contacts	
Current-transformer module	
Control, locking and interlocking	
Control	Direct front rotary handle
	Extended front rotary handle
	Direct lateral rotary handle
	Extended lateral rotary handle
Locking	By keylock
	By padlocks
Interlocking	By keylock
	Mechanical
Complete source-changeover assembly	
Operating torque (Nm) (typical value for 3-4 poles with front handle)	

Installation and Connection Accessories

Bare cable connectors
Rear connectors
Terminal extensions
Spreaders
One-piece spreader
Terminal shrouds
Terminal shields
Interphase-barrier
Front panel escutcheons
Coupling accessories
Tightening torque for electrical connections (Nm)

Dimensions and Weights

Overall dimensions H x W x D (mm)	3 poles
	4 poles
Approximate weight (kg)	3 poles
	4 poles

Enclosure Dimensions

H x W x D (mm)

Communication

Enerlin'X Digital System - Overview

Enerlin'X communication system provides access to status, electrical values and devices control using Ethernet and Modbus SL communication protocols.

Ethernet has become the universal link between switchboards, computers and communication devices inside the building. The large amount of information which can be transferred makes the connection of Enerlin'X digital system to hosted web services of Schneider Electric a reality. More advantages are offered to integrators thanks to configuration web pages available remotely or on the local Ethernet network.

Modbus SL is the most widely used communication protocol in industrial networks. It operates in master-slave mode. The devices (slaves) communicate one after the other with a gateway (master).

LVCATENLX_EN

Ethernet Gateway or Interface: routes an internal traffic (ULP or other protocole) to the Internet, the outgoing messages are coded with Modbus TCPIP protocol.

Server (Switchboard, Energy): routes the internal traffic to the Internet. Other complementary functions such as data logging and storage. Provides devices status and energy trends on internal web pages...

PowerLogic™ HeatTag: HeatTag is a smart sensor for early detection of overheating wire connections or overheating cables. HeatTag helps prevent electrical switchboards from being damaged, by analyzing gas and particles in the air and sending alerts before any smoke or insulator browning.

Note: For more information, see Configuration & commissioning guide of connected devices & software - New buildings

IFE interface + gateway, ref.: LV434002

IFE Interface, IFE Interface + Gateway Description

Introduction
The IFE interface and the IFE switchboard server enable LV circuit breakers to be connected to an Ethernet network. The IFE switchboard server incorporates a Modbus gateway. The IFE interface and IFE switchboard server are both equipped with two ULP ports and two Ethernet ports. The IFE switchboard server is equipped with a Modbus RS 485 serial connection. The following circuit breakers can be connected to IFE interface and to IFE switchboard server: Fixed type MasterPact NT/NW, ComPacT NSX or PowerPacT.

IFE Interface: Ref. LV434001
Provides an Ethernet access to a single LV circuit breaker. The circuit breaker is connected to the IFE interface via its ULP port and a prefabricated ULP cord.

IFE Switchboard Server, Ref.: LV434002
Provides an Ethernet access to one or several LV circuit breakers. It allows to interface to Ethernet:
- One single circuit breaker connected to the IFE interface via its ULP port and a prefabricated ULP cord,
- Up to 12 ComPacT NSX connected through the Modbus serial line interface.

Each ComPacT NSX is connected to Modbus by means of a dedicated IFM interface module performing the ULP/Modbus conversion.
The connection between each ComPacT NSX and its associated IFM interface is realized by a prefabricated ULP cord connected to ULP ports.

IFE Interface, IFE Switchboard Server
Provides an Ethernet access to one or several LV circuit breakers.
Functions
- Interface - one circuit breaker is connected to the IFE interface via its ULP port.
- Gateway: several circuit breakers on a Modbus network are connected via the IFE interface + gateway master Modbus port.

IFE Interface, IFE Interface + Gateway Features
- Dual 10/100 Mbps Ethernet port for simple daisy chain connection
- Device profile web service for discovery of the IFE interface, IFE interface + gateway on the LAN
- ULP compliant for localization of the IFE interface in the switchboard
- Ethernet interface for ComPacT, MasterPact and PowerPacT circuit breakers
- Gateway for Modbus-SL connected devices (IFE interface + gateway only)
- Embedded set-up web pages
- Embedded monitoring web pages
- Embedded control web pages
- Built-in e-mail alarm notification
- RBAC (Role Base Access Control) for the embedded control web pages
- RSTP (Rapid Scanning Tree Protocol) is a solution to implement redundant Ethernet networks
- Internal real-time clock with battery back-up
- RBAC (Role Base Access Control) for the embedded control web pages
- RSTP (Rapid Scanning Tree Protocol) is a solution to implement redundant
- Ethernet networks

Mounting
The IFE interface and the IFE switchboard server are DIN rail mounting devices. A stacking accessory enables the user to connect several IFMs (ULP to Modbus serial line interfaces) to an IFE switchboard server without additional wiring.

24 V DC Power Supply
The IFE interface and the IFE switchboard server must be supplied either with a 24 V DC AD or with a 24 V DC ABL8 RPS power supply. The IFMs stacked to an IFE switchboard server are supplied by the IFE, thus it is not necessary to supply them separately.
Note: The connection of the +/- of the power supply on +/- terminals of the IFE device must be strictly respected. Crossing the polarities may damage the device.

IFE Interface, IFE Switchboard Server Firmware Update
The firmware can be updated using the EcoStruxure Power Commission software.

Required Circuit Breaker Communication Modules
The connection to IFE interface or to IFE switchboard server requires ULP communication ports.
- MasterPact NT/NW (Fixed or drawout): BCM ULP communication module.
- Drawout MasterPact NT/NW: BCM ULP and its respective I/O (Input/Output) application module.

All connection configurations for MasterPact NT/NW require the breaker ULP cord. The insulated NSX cord is mandatory for system voltages greater than 480 V AC. When the second ULP RJ45 connector is not used, it must be closed with an ULP terminator (TRV00880).

Characteristic		Value
Type of interface module		Modbus RTU, RS485 serial connection Modbus TCP/IP Ethernet

- H ULP RJ45 connectors
- I Stacking accessory connection

Function

IFM - Modbus communication interface - is required for connecting MasterPact MTZ, NT/NW or ComPacT NS and NSX to Modbus network whenever the circuit breaker has an ULP port (Universal Logic Plug). The port is available on BCM ULP for MasterPact range and BSCM module for ComPacT range.

Note: IFM is defined as an IMU (Intelligent Modular Unit) within the ULP connection System documentation.

Once connected to IFM, the circuit breaker is considered as a slave by the Modbus master. Its electrical values, alarm status, open/close signals car be monitored or controlled by a Programmable Logic Controller or any other system.

Characteristics

ULP port

2 RJ45 sockets, internal parallel wiring.
- Connection of a single circuit breaker.
- An ULP line terminator must be connected to the second RJ45 ULP socket.

The RJ45 sockets deliver a 24 V DC supply fed from the Modbus socket.
Built-in test function, for checking the correct connection to the circuit breaker.

Modbus slave port

- Modbus Serial RJ45 port - RJ45 connector provides fast and reliable wiring.
- Lateral socket, for DIN rail stackable connector.
- Both top and lateral sockets are internally parallel wired.
- Multiple IFM can be stacked, thus sharing a common power supply and Modbus line without individual wiring.
- On the front face:
  - Modbus address setting (1 to 99): 2 coded rotary switches
  - Modbus locking pad: enables or disable the circuit breaker remote control and modification of IFM parameters.
- Self adjusting communication format (Baud rate, parity).

24 V DC power supply

- Screw clamp terminal block
- High electrical insulation between Modbus and 24 V DC connectors
- Separated lines provides improved communication robustness.

Communication
COM Option in ComPacT and MasterPact

All the MasterPact devices can be fitted with the communication function thanks to the COM option.
MasterPact uses the Ethernet or Modbus communications protocol for full compatibility with the supervision management systems.
Eco COM is limited to the transmission of metering data. It is not used to communicate status and controls.

For fixed and Drawout devices, the common communication option is made up of:

- A BCM ULP module, installed behind the MicroLogic control unit and supplied with its set of sensors (OF, SDE, PF and CH micro switches) its kit for connection to XF and MX1 communicating voltage releases and its COM terminal block (inputs E1 to E6). This module is independent of the control unit. It receives and transmits information on the communication network. An infra-red link transmits data between the control unit and the communication module.
  Consumption: 30 mA, 24 V.
- IFM, this module required for connection to the network, contains the Modbus address (1 to 99) declared by the user via the two dials in front. It automatically adapts (baud rate, parity) to the Modbus network in which it is installed.

Or

- IFE, the Ethernet interface for LV circuit breaker enables an intelligent modular unit (IMU), for example a MasterPact NT/NW or ComPacT NSX circuit breaker to be connected to an Ethernet network. Each circuit breaker has its own IFE and a corresponding IP address.

For drawout device the Cradle Management option must be added:
I/O (Input/Output) application module for LV breaker, the I/O application module is delivered with withdrawable devices ordered with the COM option, for cradle management. It must be installed on a DIN rail near the device. It must be connected to the ULP system and to the position contacts (CD, CT, CE) that transmit the position of the device in the cradle.

For communicating remote control, option with XF and MX1 communicating voltage releases must be added:
The XF and MX1 communicating voltage releases are equipped for connection to the "device" communication module.
The remote-tripping function (MX2 or MN) are independent of the communication option. They are not equipped for connection to the "device" communication module.

PB103786.eps

BSCM module

BSCM Module

Functions
The optional BSCM Breaker Status & Control Module is used to acquire device status indications and control the communicating remote-control function.
It includes a memory used to manage the maintenance indicators.

Status indications
Indication of device status:
O/F, SD and SDE.

Maintenance indicators
The BSCM module manages the following indicators:

- Mechanical operation counter
- Electrical operation counter
- History of status indications.

It is possible to assign an alarm to the operation counters.

Controls
The module can be used to carry out communicating remote control operations: (open, close and reset) in different modes (manual, auto).

Mounting
The BSCM module can be installed on all ComPacT NSX circuit breakers and switch-disconnectors. It simply clips into the auxiliary contact slots. It occupies the slots of one O/F contact and one SDE contact. The BSCM is supplied with 24 V DC power automatically via the NSX cord when the communication system is installed.

Communication
I/O Application Module

PB119234_1.eps

I/O application module

I/O Application Module Description

Description

The I/O input/output application module for LV breaker is one of the components of ULP architecture. Built in functionalities and applications enhance control and monitoring needs.
ULP system architecture including I/O modules can be built without any restrictions using a wide range of circuit breakers:

- MasterPact MTZ1/MTZ2/MTZ3/NT/NW
- ComPacT NS1600b-3200
- ComPacT NS630b-1600
- ComPacT NSX100-630 A.

The I/O application module is compliant with the ULP system specifications.
Two I/O application modules can be connected in the same ULP architecture.

I/O input/output interface for LV breaker resources

The I/O application module resources are the following:

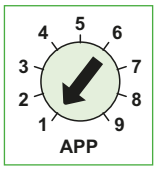
- 6 digital inputs that are self powered for either NO and NC dry contact or pulse counter
- 3 digital outputs that are bistable relay (5 A maximum)
- 1 analog input for Pt100 temperature sensor.

Pre-defined applications

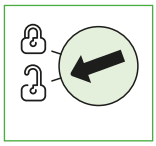
Pre-defined applications improve the IMU approach (Intelligent Modular Unit) in a simple way.
A 9-position rotary switch on the front of the I/O module allows to select the pre-defined applications. Each position is assigned to a pre-defined application except position 9 which allows the user to define a specific application by means of the customer engineering tool. The switch is set in factory to the pre-defined application 1.

For each application the input/output assignment and the wiring diagram are pre-defined. No additional setting with the customer engineering tool is required.
The I/O and other resources not assigned to the pre-defined applications are free for user specific applications.

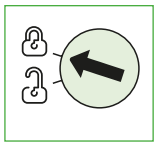
DB419578.eps



DB419579.eps



DB419580.eps



User applications

The user applications with the corresponding resources are defined by means of EcoStruxure Power Commission engineering tool. They use the resources not assigned to the predefined applications. User applications may be required for:

- Protection improvement
- Circuit breaker control
- Motor control
- Energy management
- Monitoring.

24 V DC power supply

The I/O module must be supplied either with a 24 V DC AD or with a 24 V DC ABL8 RPS power supply.

Note: The connection of the +/- of the power supply on +/- terminals of the I/O module must be strictly respected. Crossing the polarities may damage the device.

Mounting

The I/O is a DIN rail mounting device.

Setting Locking Pad

The setting locking pad on the front panel of the I/O enables the setting of the I/O by EcoStruxure Power Commission engineering tool.

General characteristics

Environmental characteristics

Conforming to standards		IEC 60950, IEC 60947-6-2, UL 508, UL 60950, IACS E10
Certification		c UL us, CE, EAC, FCC marking
Ambient temperature	storage	-40 to +85 °C
	operation	-25 to +70 °C
Relative humidity		5 - 85 %
Level of pollution		Level 3
Protective treatment		ULV0 conforming to IEC/EN 60068-2-30

Mechanical characteristics

Shock resistance	Conforming to IEC/EN 60068-2-27 15 g/11 ms, 1/2 sinusoidal
Resistance to sinusoidal vibrations	Conforming to IEC/EN 60068-2-6 5 Hz < f < 8.4 Hz

Electrical characteristics

Consumption	165 mA at 24 V DC
Resistance to electrostatic discharge	IEC/EN 61000-4-2: ■ 8 kV air discharge ■ 6 kV contact discharge
Immunity to radiated fields	IEC/EN 61000-4-3: 10 V/m
Immunity to fast transient perturbations	IEC/EN 61000-4-4: 2 kV
Immunity to surges	IEC/EN 61000-4-5: 2 kV common mode
Immunity to conducted radio frequency field	IEC/EN 61000-4-6: 10 V

Physical characteristics

Dimensions	71.7 x 116 x 70.6 mm
Mounting	DIN rail
Weight	229.5 g (0.51 lb)
Degree of protection of the installed I/O application module	On the front panel (wall mounted enclosure): IP4x I/O parts: IP3x Connectors: IP2x
Connections	Screw type terminal blocks

Digital inputs

Digital input type	Self powered digital input with current limitations as per IEC 61131-2 type 2 standards (7 mA)
Input limit values at state 1 (close)	19.8 - 25.2 V DC, 6.1 - 8.8 mA
Input limit values at state 0 (open)	0 - 19.8 V DC, 0 mA
Maximum cable length	10 m

Note: For a length greater than 10 m and up to 300 m, it is mandatory to use a shielded twisted cable. The shield cable is connected to the I/O functional ground of the I/O application module.

Digital outputs

Digital output type	Bistable relay
Rated voltage	250 V AC maximum [1]/30 V DC
Rated carry current	5 A
Contact resistance	30 mΩ
Maximum operating frequency	18000 operations/hr (Mechanical) 1800 operations/hr (Electrical)
Digital output relay protection by an external fuse	External fuse of 5 A or less
Maximum cable length	10 m

Analog inputs

I/O application module analog input can be connected to a Pt100 temperature sensor.

Range	-30 to 200 °C	-22 to 392 °F
Accuracy	±2 °C from -30 to 20 °C ±1 °C from 20 to 140 °C ±2 °C from 140 to 200 °C	±3.6 °F from -22 to 68 °F ±1.8 °F from 68 to 284 °F ±3.6 °F from 284 to 392 °F

Communication

Communications Modules, IFM and IFE for Com**PacT** NSX

All Com**PacT** NSX devices can be equipped with the communication function via a prewired connection system and a Modbus or Ethernet network interface.
The interface can be connected directly or via the FDM121 switchboard display unit. Four functional levels can be combined to adapt to all supervision requirements.

Four Functional Levels

The ComPacT NSX can be integrated in a Modbus or Ethernet communication environment. Four functional levels can be used separately or combined.

Communication of status indications
This level is compatible with all ComPacT NSX circuit breakers, whatever the trip unit, and with all switch-disconnectors. Using the BSCM module, the following information is accessible:
- ON/OFF position (O/F)
- Trip indication (SD)
- Fault-trip indication (SDE).

Communication of commands
Also available on all circuit breakers and switch-disconnectors, this level (communicating remote control) can be used to:
- Open
- Close
- Reset.

Modbus principle
The Modbus RS 485 (RTU protocol) system is an open bus on which communicating Modbus devices (ComPacT NS with Modbus COM, Power Meter PM700, PM800, Sepam, Vigilohm, ComPacT NSX, etc.) are installed. All types of PLCs and microcomputers may be connected to the bus.

Addresses
The Modbus communication parameters (address, baud rate, parity) are entered using the Electrical Asset Manager or RSU (Remote Setting Utility).

Number of devices
The maximum number of devices that may be connected to the Modbus bus depends on the type of device (ComPacT with Modbus COM, PM700, PM800, Sepam, Vigilohm, ComPacT NSX, etc.), the baud rate (19200 is recommended), the volume of data exchanged and the desired response time. The RS 485 physical layer offers up to 32 connection points on the bus (1 master, 31 slaves).
A fixed device requires only one connection point (communication module on the device). A drawout device uses two connection points (communication modules on the device and on the chassis).
The number must never exceed 31 fixed devices or 15 drawout devices.

Length of bus
The maximum recommended length for the Modbus bus is 1200 meters.

Bus power source
A 24 V DC power supply is required (less than 20 % ripple, insulation class II).

Ethernet Principle

Ethernet is a data link and physical layer protocol defined by IEEE 802 10 and 100 Mbps specifications that connects computer or other Ethernet devices. Ethernet is an asynchronous Carrier Sense Multiple Access with Collision detection (referred as CSMA/CD) protocol. Carrier Sense means that the hosts can detect whether the medium (coaxial cable) is idle or busy. Multiple Access means that multiple hosts can be connected to the common medium. Collision Detection means a host detects whether its transmission has collided with the transmission of another host (or hosts). IFE Ethernet interface can be connected to a PC or a laptop over Ethernet. The maximum length of Ethernet cable is 100 meters. IFE Ethernet interface + gateway provides a Modbus TCP/IP gateway over Ethernet to enable Modbus TCP communication from a Modbus TCP master to any Modbus slave devices connected to it. The maximum active Modbus TCP client connection is twelve.
IFE Ethernet interface has an embedded web server (web page).
The Modbus RS 485 (RTU protocol) system is an open bus on which communicating Modbus devices (ComPacT NS with Modbus COM, Power Meter PM700, PM800, Sepam, Vigilohm, ComPacT NSX, etc.) are installed. All types of PLCs and microcomputers may be connected to the bus.

A

Connections

- ■ ComPacT NSX is connected to the I/O application module or FDM121 display unit via the internal terminal block for the NSX cord equipped with an RJ45 connector:
- □ Cord available in three lengths: 0.35 m, 1.3 m and 3 m
- □ Insulated 1.3 m version for installations > 480 V AC
- □ Lengths up to 10 m possible using extensions.
- ■ The FDM121 display unit and the I/O application module are connected to:
- □ The IFM Modbus interface by a communication cable with RJ45 connectors on both ends

  or
- □ The IFE Ethernet interface module by a communication cable with RJ45 connectors on both ends.

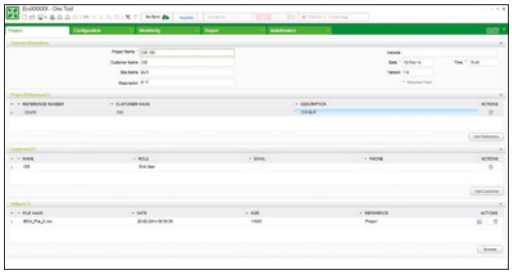
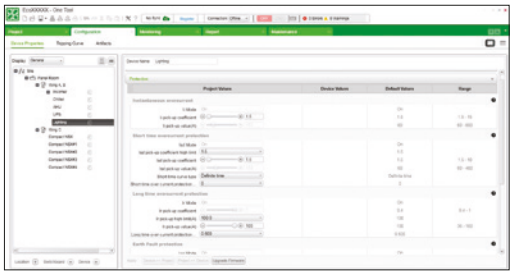
Electrical Asset Manager Configuration Engineering Tool

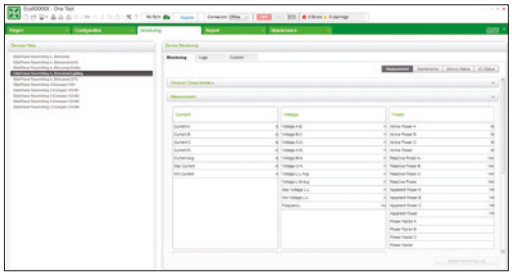
Capture1b.eps



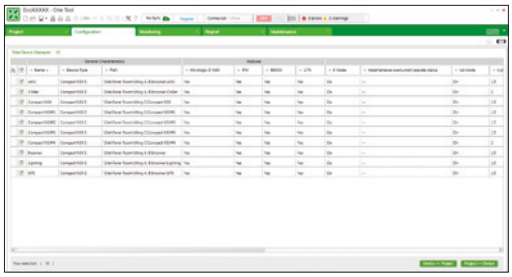
Capture2b.eps



Capture3b.eps



Capture4b.eps



Introduction

Electrical Asset Manager is a software application that helps the user to manage a project as part of designing, testing, site commissioning, and maintenance of the project life cycle.
It enables the user to prepare the settings of the devices offline (without connecting to the device) and configure them when connected with the devices.
It also provides several other value added features for the user to manage the project such as: repository in cloud, attach artifacts to each device or at the project level, organize devices in switchboard wise, manage a hierarchical structure of the installation.

Compatible Devices (Configuration and Device Management)

Electrical Asset Manager is compatible with the following devices:

- ComPacT NSX100-630 (IEC)
- PowerPacTTM (UL) circuit breaker
- ComPacT NS630b-3200 (IEC)
- MasterPact NT/NW (IEC and UL) circuit breaker
- Acti**9** Smartlink.
- Compatible devices (Device Management in the project)
- Switch disconnectors (ComPacT NSX, MasterPact & PowerPacT Family)
- Third party devices.

References:
Electrical Asset Manager software package can be downloaded from our website www.schneider-electric.com.

Features

Electrical Asset Manager supersedes the Schneider Electric customer engineering tools such as Remote setting Utility (RSU) and Remote Control Utility (RCU) with additional features.

Electrical Asset Manager supports the connection of Schneider Electric communicable devices to:

- Create projects by device discovery, selection of devices, and import Bill of Material (BOM)
- Monitor the status of protection and IO status
- Read information (alarms, measurements, parameters)
- Check protection selectivity between two devices
- Upload and download of configuration or settings in batch mode to multiple devices.
- Carry out commands and tests
- Generate and print device settings report and communication test report
- Manage multiple devices with electrical and communication hierarchy model
- Manage artifacts (project documents)
- Check consistency in settings between devices on a communication network
- Compare configuration settings between PC and device (online)
- Download latest firmware.

Electrical Asset Manager enables the user to avail the advanced features of the software once the project is saved in Schneider Electric cloud.

Functions

Offline Mode
A project can be built in offline mode through 2 different ways:
- Through BOM file import
- Through Device Selection.

Additionally, the user can open an existing project and modify the settings offline. The user can do the selectivity curve check and firmware compatibility check for devices in the project.

Online Mode
A project can be built in online mode through device discovery also other than the methods possible through offline method.
Once the project is built, the following functions can be performed in addition to the functions available in offline mode:
- Compare the device parameters with project parameters
- Load parameters from project to the device and vice versa
- Firmware downloads to the device
- Monitor the measurement, maintenance, device status and I/O status
- Control functions.

User Interface
Electrical Asset Manager software provides fast direct access to the project and the devices in the project through different tabs.
- Project: to provide the project information including customer details, project references and to add project artifacts (documents related to the project).
- Configuration: to build up the tree structure of the project architecture ; to have a table view of the devices added in the project ; to set the parameters of the devices ; to transfer the device settings ; to view the tripping curves; to attach device artifacts and to download the latest firmware, to do the communication test for all the devices and generate the test report.
- Monitoring: this allows the user to monitor the real time values of different devices through different sub tabs namely Monitoring, Logs and Control.
- Reports: report tab allows you to generate and print a report of the project settings from the report tab. The user details and project characteristics are automatically filled with the details entered in the Project page.

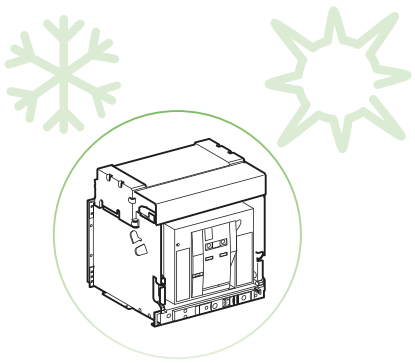
A

General Characteristics of MasterPact NW DC, EPDC, DC PV

Operating Conditions

MasterPact circuit breakers have been tested for operation in industrial atmospheres. It is recommended that the equipment be cooled or heated to the proper operating temperature and kept free of excessive vibration and dust.

DB431749.eps

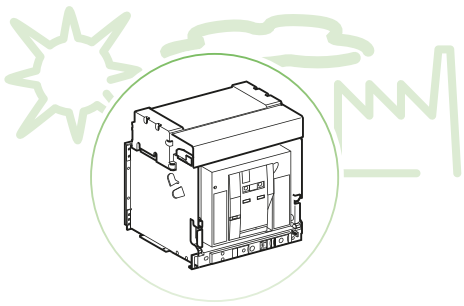


Ambient Temperature

MasterPact devices can operate under the following temperature conditions:
- The electrical and mechanical characteristics are stipulated for an ambient temperature of -25 °C to +70 °C
- Circuit breaker closing is ensure down to -35 °C by manual operation (push button).

Storage conditions are as follows:
- -40 to +85 °C for a MasterPact device without its control unit
- -25 °C to +85 °C for the control unit.

DB431750.eps

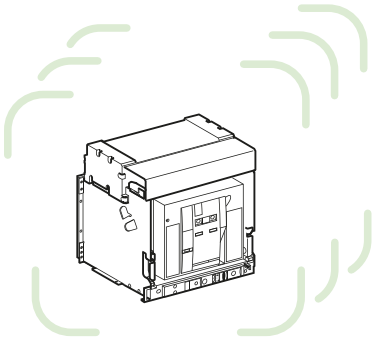


Severe Atmospheric Conditions

MasterPact devices have successfully passed the tests defined by the following standards for severe atmospheric conditions:
- IEC 60068-2-1: dry cold at -40 °C
- IEC 60068-2-2: dry heat at +85 °C
- IEC 60068-2-30: damp heat (temperature +55 °C, relative humidity 95 %)
- IEC 60068-2-52 level 2: salt mist.

MasterPact devices can operate in the industrial environments defined by standard IEC 60947 (pollution degree up to 3).
It is nonetheless advised to check that the devices are installed in suitably cooled switchboards without excessive dust.

DB431751.eps



Vibrations

MasterPact devices have successfully passed testing in compliance with IEC 60068-2-6 for the following vibration levels:
- 2 to 13.2 Hz: amplitude ±1 mm
- 13.2 to 100 Hz: constant acceleration 0.7 g.

Vibration testing to these levels is required by merchant marine inspection organizations (Veritas, Lloyd's, etc). Some applications have vibration profiles outside of this standard and require special attention during application design, installation, and use. Excessive vibration may cause unexpected tripping, damage to connections or to other mechanical parts. Please refer to the MasterPact maintenance guide (causes of accelerated ageing/operating conditions/vibrations) for additional information.
Examples of applications with high vibration profiles could include:
- Wind turbines
- Power frequency converters that are installed in the same switchboard or close proximity to the MasterPact circuit breaker
- Emergency generators
- High vibration marine applications such as thrusters, anchor positioning systems, etc.

General Characteristics of MasterPact NW DC, EPDC, DC PV

MasterPact NW DC, EPDC, DC PV

Altitude

At altitudes higher than 2000 metres, the modifications in the ambient air (electrical resistance, cooling capacity) lower the following characteristics as follows:

Altitude (m)		2000	3000	4000	5000
NW DC					
Impulse withstand voltage Uimp (kV)		12	10.6	9.5	8.4
Rated insulation voltage (Ui)		1000	900	800	700
Maximum rated operationnal voltage 50/60 Hz Ue (V)	NW DC ≤500 V	500	450	390	350
	NW DC 500-900 V	900	800	700	630

Rated current (A) at 40 °C		1 x In	0.98 x In	0.96 x In	0.94 x In

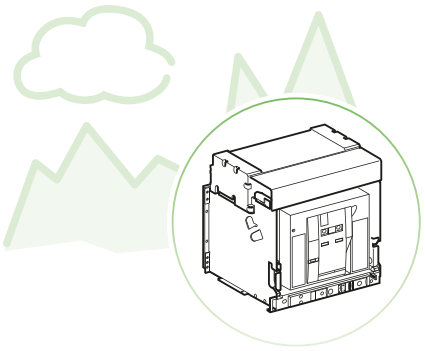
Intermediate values may be obtained by interpolation.

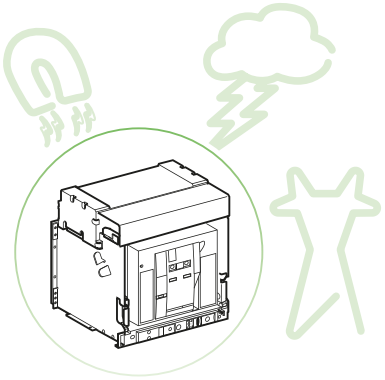


Electromagnetic Disturbances

MasterPact NW DC devices are protected against:
- Overvoltages caused by devices that generate electromagnetic disturbances
- Overvoltages caused by atmospheric disturbances or by a distribution-system outage (e.g. failure of a lighting system)
- Devices emitting radio waves (radios, walkie-talkies, radar, etc.)
- Electrostatic discharges produced by users.

MasterPact NW DC devices have successfully passed the electromagnetic-compatibility tests (EMC) defined by the following international standards:
- IEC 60947-2, appendix F
- IEC 60947-2, appendix B (trip units with earth-leakage function).

The above tests ensure that:
- No nuisance tripping occurs
- Tripping times are respected.



Degree of Protection

MasterPact NW DC circuit breakers offer the following protection characteristics depending on the installation conditions:
- IP: degree of protection (standard IEC 60529)
- IK: protection against external mechanical imPacTs (standard EN 50102).

Protection Using the MicroLogic 1.0 DC Control Unit

MasterPact NW DC circuit breakers use MicroLogic 1.0 DC control units.
These interchangeable units with instantaneous thresholds, operating with electromagnetic sensors, can be adjusted on site.
The circuit breakers can be used with the three versions of sensors, defined by their setting range.

Type of sensor	1250/2500 A	2500/5400 A	5000/11000 A

Adjustments

Settings for MasterPact NW DC circuit breakers may be accessed from the front, with the switchboard door open.

- Settings are made for the input (+ pole) and the output (- pole).
- The setting range comprises eleven positions, plus five preferential settings marked **A**, **B**, **C**, **D** and **E**.
- The setting values for the two corresponding sensors must be identical.

All the accessories of the standard NW HADC switch-disconnectors can be used.

[1] NW HADCD-PV switch-disconnectors for PV applications are designed and qualified to break the rated or the fault current under 1000 V DC with all the 3 poles in series and this is a mandatory condition whatever the type of fault. This comes to say that the PV systems using these switch-disconnectors must be isolated systems from the earth and that the double fault situation (A and D or C and E on the diagram below) must be absolutely avoided: insulation monitoring devices shall detect the first fault and the staff shall look for this first fault and clear it with no delay. These switch-disconnectors cannot be used in grounded systems as in this situation they may be expected to break the current under the full voltage (1000 V DC) with only 1 pole or 2 poles in series. These devices are not designed for that purpose and could sustain irremediable damage if used to break in these conditions.

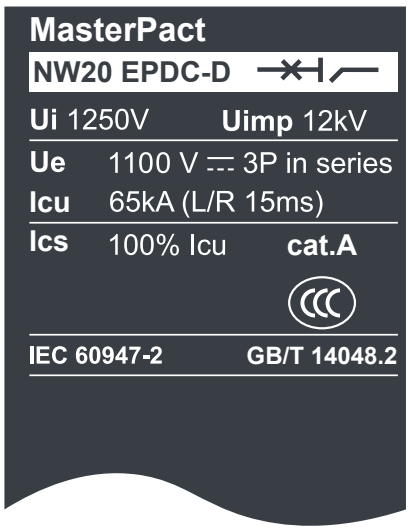
DB436631.ai



All the accessories of the standard NW HDC circuit breakers can be used.
NW EPDC-D circuit breakers were not designed for and cannot be used in PV application.

[1] NW EPDC-D circuit breakers are designed and qualified to break the rated or the fault current under 1100V DC with all the 3 poles in series, and having the 3 poles in series when breaking is a mandatory condition whatever the type of fault.
This implies 2 mandatory conditions:
- the systems using these circuit breakers must be isolated from the earth.
- avoid the double fault situation (A and D or C and E on the diagram above). For this, insulation monitoring devices must detect the first fault, and the staff must locate it and clear it with no delay.

These circuit breakers cannot be used in grounded systems as, in this situation, they may be expected to break the current under the full voltage (1100 V DC) with only 1 pole or 2 poles in series. These devices are not designed for that purpose and could sustain irremediable damage if used to break in these conditions.

Circuit Breakers and Switch-Disconnectors

MasterPact NW DC exists in fixed and withdrawable versions:
- Circuit breaker equipped with MicroLogic 1.0 DC control unit
- Switch-disconnector without the control unit.

Common Auxiliaries from 1000 to 4000 A

All accessories are:
- Accessible from the front in a compartment isolated from the power circuits
- Secured by a single screw
- No adjustments
- Adaptable on site.

Communication

Circuit breaker or switch-disconnector integration in a supervision system requires the COM option.
MasterPact uses the Modbus communication protocol compatible with ION-E electrical engineering expert system software.
An external gateway is available for communication with other networks (Profibus, Ethernet, etc.).

Connections

- Rear vertical connection in standard.
- Possibility of conversion to horizontal connection by turning the connectors On the site by the customer (except for the NW40).
- Prefabricated series connections.
- Safety shutters, shutter locking blocks.
- Optional accessories:
  - Interphase barriers
  - Shutter position indication and locking.

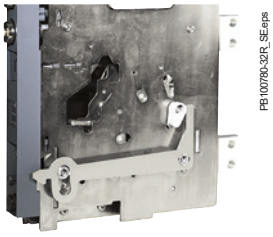
Panorama of Electrical and Mechanical Accessories

Master**Pact** NW10 to NW40 DC

Locking

- Pushbutton locking by padlockable transparent cover.
- OFF-position locking by padlock or keylock.
- Chassis locking:
  - In disconnected position by keylock
  - In connected, disconnected and test positions.
- Door interlock (inhibits door opening with breaker in connected position).
- Racking interlock (inhibits racking with door open).
- Racking interlock between crank and OFF pushbutton.
- Automatic spring discharge before breaker removal.
- Mismatch protection.

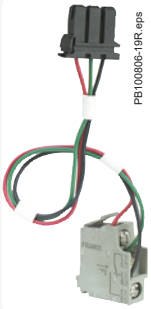
Locking in disconnected position by keylock or padlock



Door interlock (inhibits door opening with breaker in connected position)

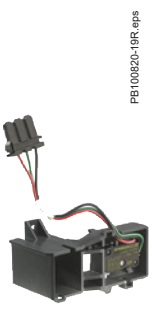
Indication Contacts

- Standard or low-level contacts:
  - ON/OFF indication (OF)
  - “fault-trip” indication (SDE)
  - Carriage switches for connected (CE), disconnected (CD) and test (CT) positions.

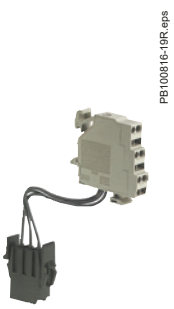


OF contact (microswitch)

OF contact (rotary)



SDE contact



Combined contact (connected/closed)

Remote Operation

- Remote ON/OFF:
  - Gear motor
  - XF closing or MX opening voltage releases
  - PF ready-to-close contact
  - Options:
  - RAR automatic or Res electrical remote reset
  - BPFE electrical closing pushbutton.
- Remote tripping function:
  - MN voltage release:
  - standard
  - adjustable or non-adjustable delay
  - Or 2nd MX voltage release.

Remote ON/OFF

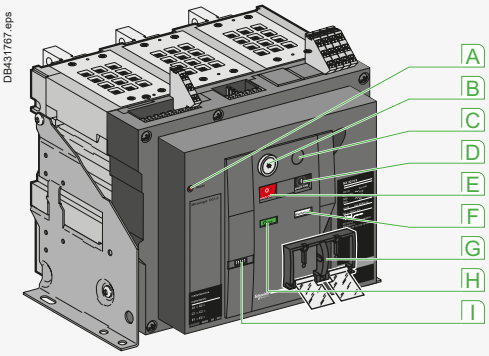
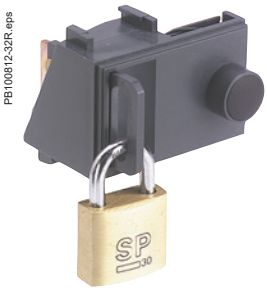
Locking on the Device



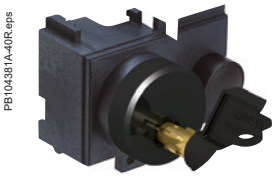
- A Fault trip indication and reset button
- B OFF position locking
- C Electrical closing pushbutton
- D ON pushbutton
- E OFF pushbuton
- F Operating mechanism charged and “ready to close” indication
- G Pushbutton locking
- H Main contact position indication
- I Operation counter

Access to pushbuttons protected by transparent cover

Pushbutton locking using a padlock



OFF position locking using a padlock



OFF position locking using a keylock

Pushbutton Locking VBP

The transparent cover blocks access to the pushbuttons used to open and close the device.
It is possible to independently lock the opening button and the closing button.
The locking device is often combined with a remote operating mechanism.
The pushbuttons may be locked using either:
- Three padlocks (not supplied)
- Lead seal
- Two screws.

Device Locking in the OFF Position
VCPO - by Padlocks - VSPO - by Keylocks

The circuit breaker is locked in the OFF position by physically maintaining the opening pushbutton pressed down:
- Using padlocks (one to three padlocks, not supplied)
- Using keylocks (one or two different keylocks, supplied).

Keys may be removed only when locking is effective (Profalux or Ronis type locks).
The keylocks are available in any of the following configurations:
- One keylock
- One keylock mounted on the device + one identical keylock supplied separately for interlocking with another device
- Two different key locks for double locking.

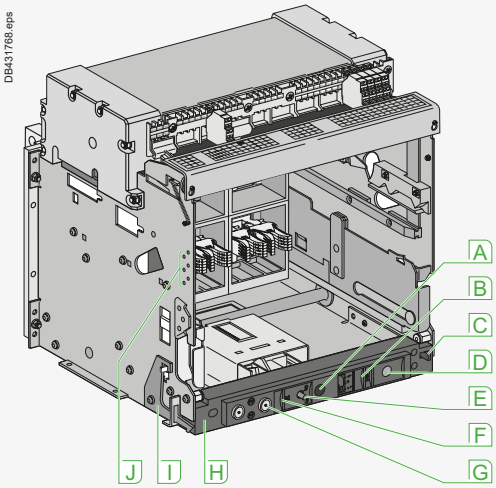
Profalux and Ronis keylocks are compatible with each other.
A locking kit (without locks) is available for installation of one or two keylocks (Ronis, Profalux, Kirk or Castell).

Accessory-compatibility
3 padlocks and/or 2 keylocks.

Cable-Type Door Interlock IPA

This option prevents door opening when the circuit breaker is closed and prevents circuit breaker closing when the door is open.
For this, a special plate associated with a lock and a cable is mounted on the right side of the circuit breaker.
With this interlock installed, the source changeover function cannot be implemented.
This option is identical for fixed or drawout versions.

Locking on the Chassis



- A Racking-handle port
- B "Connected/test/ disconnected" position indication
- C Racking interlock
- D Racking-handle storage
- E Reset pushbutton
- F Padlock locking
- G Keylock locking
- H Chassis front plate (accessible with cubicle door closed)
- I "Disconnected" position door interlock
- J Mismatch protection

"Disconnected" Position Locking By Padlocks (Standard) or Keylocks (VSPD Option)

The circuit breaker can be locked in its disconnected position by using the locks on the chassis. This feature is accessible via the cut out door closed.

Two options are available:

- Using padlocks (standard), up to three padlocks (not supplied)
- Using keylocks (optional), one or two different keylocks are available.

Profalux and Ronis keylocks are available in different options:

- One keylock
- Two different keylocks for double locking
- One (or two) keylocks mounted on the chassis + one (or two) identical keylocks supplied separately for interlocking with another device.

A locking kit (without locks) is available for installation of one or two keylocks (Ronis, Profalux, Kirk or Castell).

Connected", "Disconnected" and "Test" Position Locking

The "connected", "disconnected" and "test" positions are shown by an indicator and are mechanically indexed. The exact position is obtained when the racking handle blocks. A release button is used to free it.

As standard, the circuit breaker can be locked only in "disconnected" position by padlocks or by keylocks. On request, the locking system may be modified to lock the circuit breaker in any of the three positions "connected", "disconnected" or "test".

Door Interlock Catch VPEC

Mounted on the right or left-hand side of the chassis, this device inhibits opening of the cubicle door when the circuit breaker is in "connected" or "test" position. It the breaker is put in the "connected" position with the door open, the door may be closed without having to disconnect the circuit breaker.

Racking Interlock VPOC

This device prevents insertion of the racking handle when the cubicle door is open.

Cable-Type Door Interlock IPA

This option is identical for fixed and drawout versions.

Racking Interlock between Crank and OFF Pushbutton IBPO for NW DC

This option makes it necessary to press the OFF pushbutton in order to insert the racking handle and holds the device open until the handle is removed.

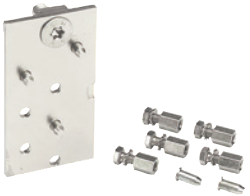
Automatic Spring Discharge Before Breaker Removal DAE for NW DC

This option discharges the springs before the breaker is removed from the chassis.

Mismatch Protection V DC

Mismatch protection ensures that a circuit breaker is installed only in a chassis with compatible characteristics. It is made up of two parts (one on the chassis and one on the circuit breaker) offering twenty different combinations that the user may select.

Racking interlock



Mismatch protection

Electrical and Mechanical Accessories
MasterPact NW10 to NW40 DC

Indication contacts are available:
- In the standard version for relay applications
- In a low-level version for control of PLCs and electronic circuits.

		V DC	24/48	6
			125	6
			250	3

[1] Standard contacts: 10 A; optional contacts: 6 A.

“Fault-Trip” Indication Contacts SDE

Circuit breaker tripping due to a fault is signalled by:
- A red mechanical fault indicator (reset)
- One changeover contact SDE.

Following tripping, the mechanical indicator must be reset before the circuit breaker may be closed. One SDE is supplied as standard. An optimal SDE may be added. This latter is incompatible with the electrical reset after fault-trip option (Res).

SDE				
Supplied as standard				1
Maximum number				2
Breaking capacity (A) p.f.: 0.3 AC12/DC12	Standard			minimum load: 100 mA/24 V

“Connected”, “Disconnected” and “Test” Position Carriage Switches

Three series of optional auxiliary contacts are available for the chassis:

- Changeover contacts to indicate the “connected” position CE
- Changeover contacts to indicate the “disconnected” position CD. This position is indicated when the required clearance for isolation of the power and auxiliary circuits is reached.
- Changeover contacts to indicate the “test” position CT. In this position, the power circuits are disconnected and the auxiliary circuits are connected.

Additional actuators

A set of additional actuators may be installed on the chassis to change the functions of the carriage switches.

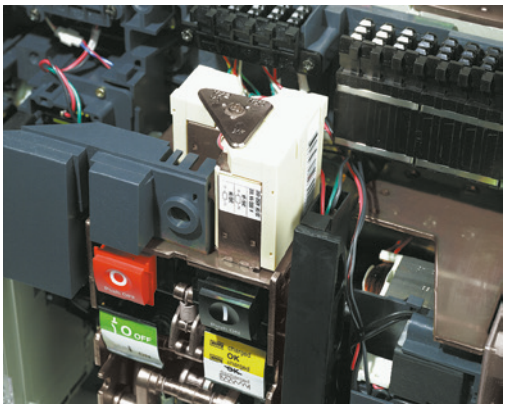
Master**Pact** NW10 to NW40 DC

Two solutions are available for remote operation of Master**Pact** devices:
- A point-to-point solution
- A bus solution with the COM communication option.

A



PB104349A-08R.eps

Note:
An opening order always takes priority over a closing order. If opening and closing orders occur simultaneously, the mechanism discharges without any movement of the main contacts. The circuit breaker remains in the open position (OFF).
In the event of maintained opening and closing orders, the standard mechanism provides an anti-pumping function by blocking the main contacts in open position.
Anti-pumping function. After fault tripping or intentional opening using the manual or electrical controls, the closing order must first be discontinued, then reactivated to close the circuit breaker.
When the automatic reset after fault trip (RAR) option is installed, to avoid pumping following a fault trip, the automatic control system must take into account the information supplied by the circuit breaker before issuing a new closing order or blocking the circuit breaker in the open position. (information on type of fault: overload, short time delay, earth-leakage fault, fault vigi or short-circuit, etc.)

Note:
MX communicating releases are of the impulse type only and cannot be used to lock a circuit breaker in OFF position. For locking in OFF position, use the remote tripping function (2nd MX or MN).

When Mx or XF communicating releases are used, the third wire (C3, A3) must be connected even if the communication module is not installed. When the control voltage (C3-C1 or A3-A1) is applied to the MX or XF releases, it is necessary to wait 1.5 seconds before issuing an order. consequently, it is advised to use standrad MX or XF releases for applications such as source-changeover systems.

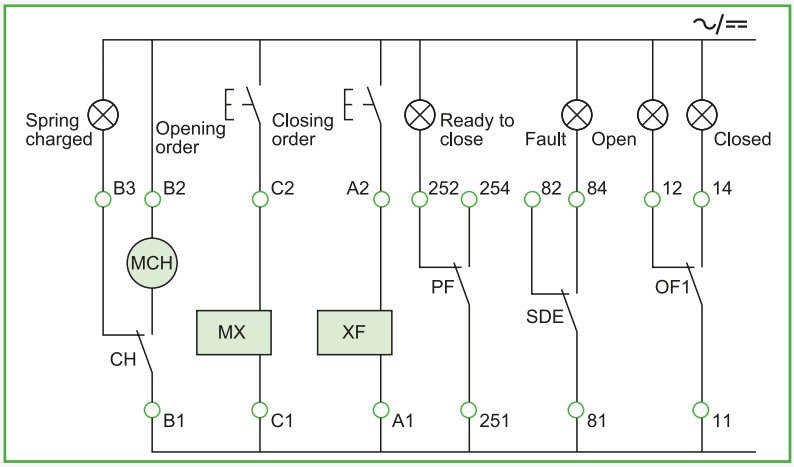
Remote Operation: Remote ON/OFF

The remote ON/OFF function is used to remotely open and close the circuit breaker.
It is made up of:
- An electric motor MCH equipped with a “springs charged” limit switch contact CH
- Two voltage releases:
  - A closing release XF
  - An opening release MX.

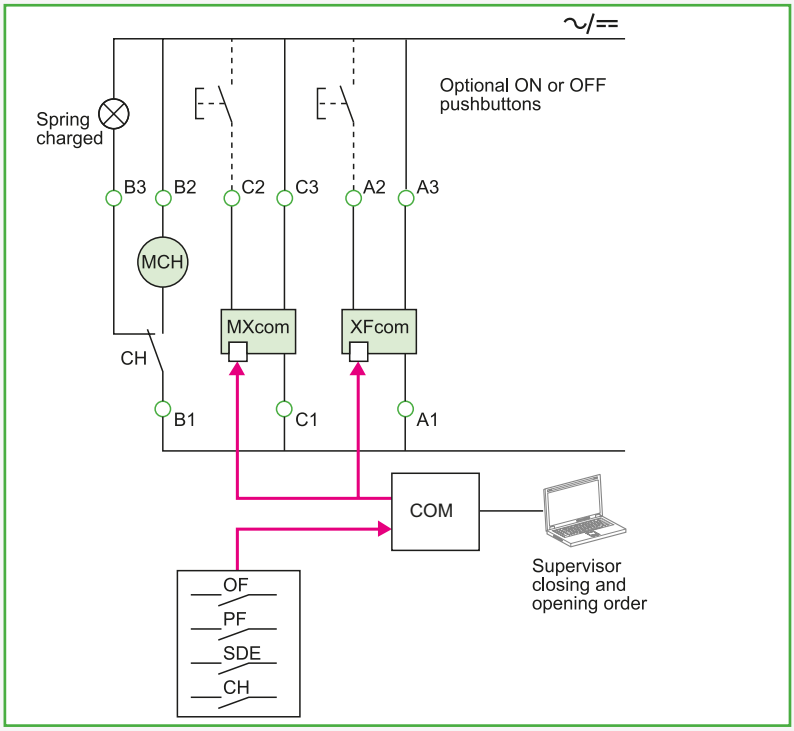
Optionally, other functions may be added:
- A “ready to close” contact PF
- An electrical closing pushbutton BPFE
- Remote RES following a fault.

A remote-operation function is generally combined with:
- Device ON/OFF indication OF
- “fault-trip” indication SDE.

Wiring diagram of a point-to-point remote ON/OFF function



Wiring diagram of a bus-type remote ON/OFF function



Electric Motor MCH

The electric motor automatically charges and recharges the spring mechanism when the circuit breaker is closed. Instantaneous reclosing of the breaker is thus possible following opening. The spring-mechanism charging handle is used only as a backup if auxiliary power is absent.
The electric motor (MCH) is equipped as standard with a limit switch contact (CH) that signals the “charged” position of the mechanism (springs charged).

Characteristics		
Power supply	V AC 50/60 Hz	48/60 - 100/130 - 200/240 - 277 - 380/415 - 400/440 - 480
	V DC	24/30 - 48/60 - 100/125 - 200/250
Operating threshold		0.85 to 1.1 Un
Consumption (VA or W)		180

Charging time		maximum 4 seconds
Operating frequency		maximum 3 cycles per minute
CH contact		10 A at 240 V

PB100808-32R.eps

Electric motor MCH for MasterPact NW DC

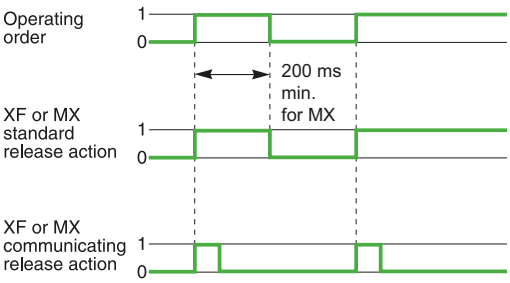
Voltage Releases XF and MX

Their supply can be maintained or automatically disconnected.

Closing release XF
The XF release remotely closes the circuit breaker if the spring mechanism is charged.

Opening release MX
The MX release instantaneously opens the circuit breaker when energized, the minimum duration of the pulse operating order must be 200 ms. The MX release locks the circuit breaker in OFF position if the order is maintained (except for MX “communicating” releases).
Note: Whether the operating order is maintened or automatically disconnected (pulse-type), XF or MX “communicating” releases (“bus” solution with “COM” communication option) always have an impulse-type action (see diagram).

Characteristics		XF	MX
Power supply	V AC 50/60 Hz	24 - 48 - 100/130 - 200/250 - 277 - 380/480	
	V DC	12 - 24/30 - 48/60 - 100/130 - 200/250	
Operating threshold		0.85 to 1.1 Un	0.7 to 1.1 Un
Consumption (VA or W)		pick-up: 200 (during 200 ms) hold: 4.5	pick-up: 200 (during 200 ms) hold: 4.5
Circuit breaker response time at Un		70 ms ±10 (NW DC ≤ 4000 A) 80 ms ±10 (NW DC > 4000 A)	50 ms ±10 (NW DC)



DB431945.eps

“Ready to Close” Contact PF

The “ready to close” position of the circuit breaker is indicated by a mechanical indicator and a PF changeover contact. This signal indicates that all the following are valid:
- The circuit breaker is in the OFF position
- The spring mechanism is charged
- A maintained opening order is not present:
  - MX energized
  - Fault trip
  - Remote tripping second MX or MN
  - Device not completely racked in
  - Device locked in OFF position
  - Device interlocked with a second device.

Characteristics				
Supplied as standard				-

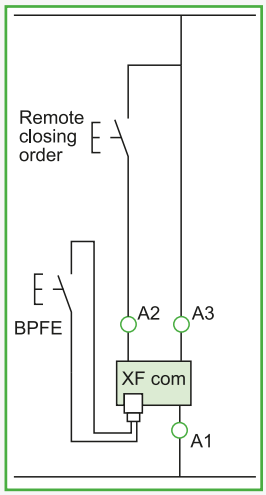
Electrical Closing Pushbutton BPFE

Located on the front panel, this pushbutton carries out electrical closing of the circuit breaker. It is generally associated with the transparent cover that avoids access to the closing pushbutton.
Electrical closing via the BPFE pushbutton takes into account all the safety functions that are part of the control/monitoring system of the installation.
The BPFE connects to the closing release XF in place of the COM module.
The COM module is incompatible with this option.
Different types of voltage exist and the XF electromagnet is compulsary if the BPFE option is selected.

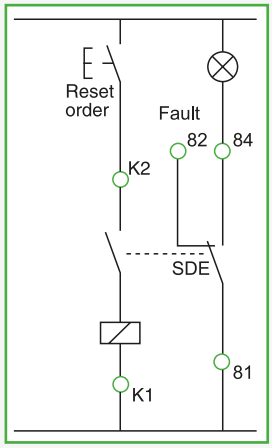
DB431772.eps



Remote Reset After Fault Trip

Electrical reset after fault trip RES
Following tripping, this function resets the “fault trip” indication contacts SDE and the mechanical indicator and enables circuit breaker closing.
Power supply: 110/130 V AC and 200/240 V AC.
The use of XF closing release is compulsory with this option.

DB431773.eps



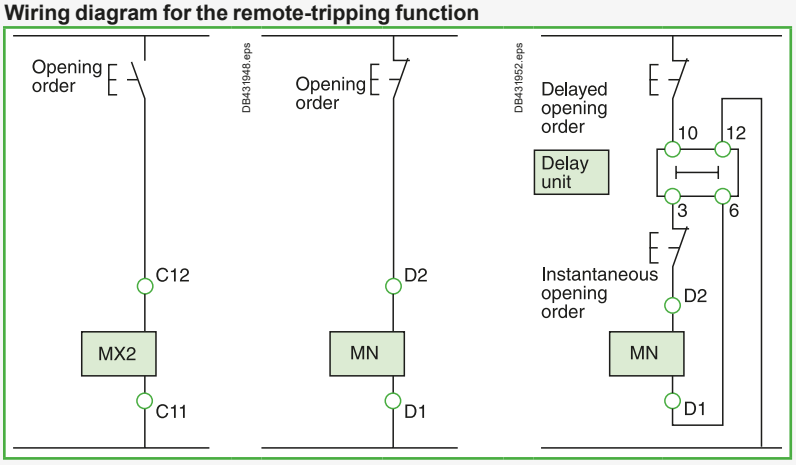
Automatic reset after fault trip RAR
Following tripping, a reset of the mechanical indicator (reset button) is no longer required to enable Circuit breaker closing. The mechanical (reset button) and electrical SDE indications remain in fault position until the reset button is pressed.
The use of XF closing release is compulsory with this option.

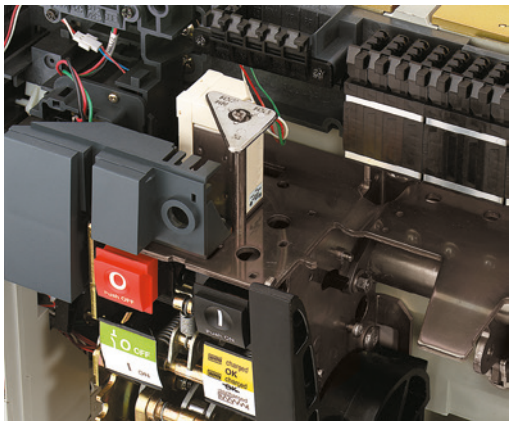
Remote Operation: Remote Tripping

This function opens the circuit breaker via an electrical order. It is made up of:
- A shunt release second MX
- Or an undervoltage release MN
- Or a delayed undervoltage release MNR: (MN + delay unit).

These releases (2nd MX or MN) cannot be operated by the communication bus. The delay unit, installed outside the circuit breaker, may be disabled by an emergency OFF button to obtain instantaneous opening of the circuit breaker.

Wiring diagram for the remote-tripping function





A

Voltage Releases Second MX

When energized, the MX voltage release instantaneously opens the circuit breaker. A continuous supply of power to the second MX locks the circuit breaker in the OFF position.

Characteristics			
Power supply	V AC 50/60 Hz	24 - 48 - 100/130 - 200/250 - 277 - 380/480	
	V DC	24/30 - 48/60 - 100/130 - 200/250	
Operating threshold		0.7 to 1.1 Un	
Permanent locking function		0.85 to 1.1 Un	
Consumption (VA or W)		pick-up: 200 (during 80 ms)	hold: 4.5
Circuit breaker response time at Un		50 ms ±10	

Instantaneous Voltage Releases MN

The MN release instantaneously opens the circuit breaker when its supply voltage drops to a value between 35 % and 70 % of its rated voltage. If there is no supply on the release, it is impossible to close the circuit breaker, either manually or electrically. Any attempt to close the circuit breaker has no effect on the main contacts. Circuit breaker closing is enabled again when the supply voltage of the release returns to 85 % of its rated value.

Characteristics			
Power supply	V AC 50/60 Hz	24 - 48 - 100/130 - 200/250 - 380/480	
	V DC	12 - 24/30 - 48/60 - 100/130 - 200/250	
Operating threshold	opening	0.35 to 0.7 Un	
	closing	0.85 Un	
Consumption (VA or W)		pick-up: 200 (during 200 ms)	hold: 4.5
MN consumption with delay unit		pick-up: 200 (during 200 ms)	hold: 4.5
Circuit breaker response time at Un		90 ms ±5	

MN Delay Units

To eliminate Circuit breaker nuisance tripping during short voltage dips, operation of the MN release can be delayed. This function is achieved by adding an external delay unit in the MN voltage-release circuit. Two versions are available, adjustable and non-adjustable.

Characteristics			
Power supply	non-adjustable	100/130 - 200/250	
VAC 50-60 Hz/DC	adjustable	48/60 - 100/130 - 200/250 - 380/480	
Operating threshold	opening	0.35 to 0.7 Un	
	closing	0.85 Un	
Consumption of delay unit alone (VA or W)		pick-up: 200 (during 200 ms)	hold: 4.5
Circuit breaker response time at Un	non-adjustable	0.25 s	
	adjustable	0.5 s - 0.9 s - 1.5 s - 3 s

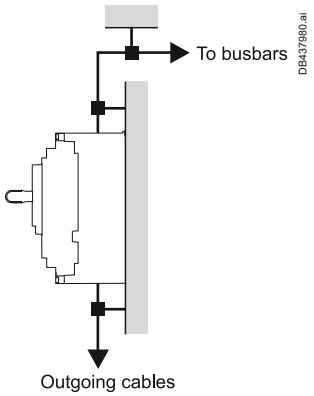
Electrodynamic Forces on the Conductors

The circuit breakers can be connected with copper, tinned copper or tinned aluminum conductors (rigid or flexible bars, cables).
In the event of a short-circuit, electrodynamic forces will be exerted on the conductors.
They must therefore be correctly sized and maintained in place using supports.
Electrical connection points on all types of devices (contactors, circuit breakers, etc.) should not be used for mechanical support.



Ties for Flexible Bars and Cables

The table below indicates the maximum distance between ties depending on the prospective short-circuit current.
The maximum distance between ties attached to the switchboard frame is 400 mm.

Type of tie	Maximum distance between ties (mm)	Short-circuit current (kA rms)
"PANDUIT" type ties Width: 4.5 mm Max. load: 22 kg White	200 100 50	10 14 19
"SAREL" type ties Width: 9 mm Max. load: 90 kg Black Double ties	350 200 100 70 50	21 27 36 45 100

Note: For 50 mm² cables, use the 9 mm wide ties.

ComPacT NSX100 to NSX1200 DC
Safety Clearances, Minimum Distances and Insulation of Live Parts

When installing a ComPacT NSX100 to 1200 DC circuit breaker, minimum distances (safety clearances) must be maintained between the device and panels, bars and other protection devices installed nearby. These distances, which depend on the ultimate breaking capacity, are defined by tests carried out in accordance with standard IEC 60947-2.
If installation conformity is not checked by type tests, it is also necessary to:
- Use insulated bars for circuit breaker connections
- Block off the busbars using insulating screens.

Terminal shields, interphase barriers and the insulation kit are recommended and may be mandatory depending on the utilization voltage and the type of installation (fixed, withdrawable).

Dimensions (mm)		Insulation, insulated bars or painted sheet metal			Sheetmetal

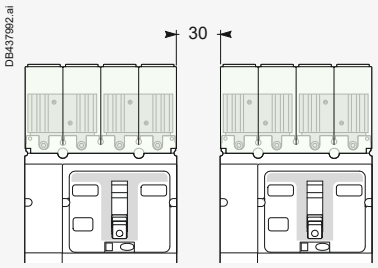
ComPacT NSX DC PV
Safety Clearances and Minimum Distances

Safety Clearance Using Terminals Shields

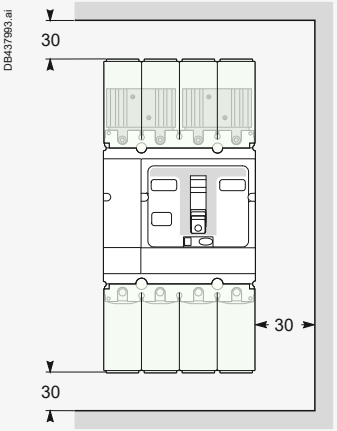
- Terminal shields must be used with all DC PV circuit breakers when operating at 1000 V DC.
- Terminal shields can be used in option with DC PV switch-disconnectors (U ⩽ 1000 V DC).

ComPacT NSX80 to 200 DC PV and ComPacT NSX250 to 500 DC PV

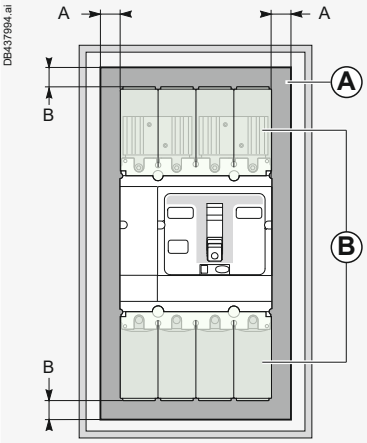
Minimal distance between two adjacent devices

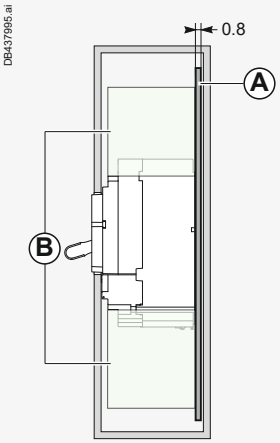


Minimal distance between the device and panels



Minimal distance between the device and panels





Dimensions (mm)	Insulation, insulated bars or painted sheet metal	
	A	B
NSX80-200 DC PV	13	13
NSX250 to 500 DC PV	26	26

(A) Fiber insulating plate to be made by the customer.
(B) Long terminal shield.

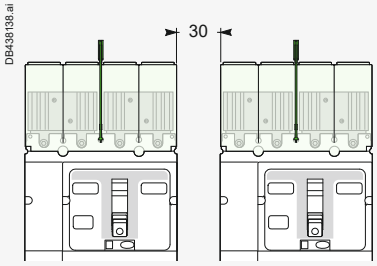
Note: The thermal behavior of switchgear and enclosures warrants careful monitoring. PV generator boxes and array boxes are usually installed outdoors and exposed to the elements. In the event of high ambient temperatures, high IP levels could reduce air flow and thermal power dissipation.
In addition, the way switchgear devices achieve high voltage operation - i.e. through the use of poles in series - increases their temperature. Special attention should therefore be paid to the temperature of switchgear inside outdoor enclosures on the DC side.
Schneider Electric recommends checking the installation as per IEC 61439 or any other equivalent standard.

Safety Clearance with Interphase Barriers

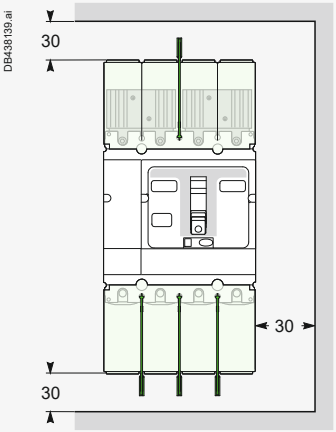
- Interphase barriers can used **only with DC PV switch-disconnectors** (U ⩽ 1000 V DC).

ComPacT NSX100 to 630 NA DC PV

Minimal distance between two adjacent devices



Minimal distance between the device and panels



Minimal distance between the device and panels

For ComPacT NSX the overload protection is calibrated at 40 °C and for C60 DC PV at 20 °C. This means that when the ambient temperature is less or greater than these temperatures, the Ir protection pickup is slightly modified.

- Temperature rise for ComPacT range have been checked with terminal shields (mandatory) heatsink on top, four cables on bottom connections with section and length according to IEC60947-1 Table 9 and 10.
- Values in the tables are provided for vertical mounting only. In case of horizontal mounting consult us. To obtain the tripping time for a given temperature:
  - See the tripping curves for 20 or 40 °C
  - Determine tripping times corresponding to the Ir value (thermal setting on the device), corrected for the breaker ambient temperature as indicated in the tables below.

[1] Temperature rise have been checked with four cables on bottom connections with section and length according to IEC60947-1 Table 9.

a. When used in array boxes, with short connection to string protections the cross section of the bars or cables shall have a higher cross section.

b. When cables have a cross section lower than the value indicated an additional 0.9 derating coefficient shall be applied. Values in the tables are provided for vertical mounting only.

[2] Take into account this derating line for products with date code over --15011.

ComPacT NSX630b to 1600 DC PV Switch-Disconnectors [1]

All the given values come from connections tests.
For other kind of connections (rear horizontal/rear vertical) the values remain the same.

[1] For a switch-disconnector mounted in horizontal position, the derating to be applied is equivalent to that of a front or horizontal rear connected switch-disconnector.

The values indicated in the tables opposite are typical values.

Power dissipated per pole (P/pole) in Watts (W)
The value indicated in the table is the power dissipated at I_N, four-pole switchboard (these values can be higher than the power calculated on the basis of the pole resistance). Measurement and calculation of the dissipated power are carried out in compliance with the recommendations of Annex G of standard IEC 60947-2.

Resistance per pole (R/pole) in milliohms (mΩ)
The value of the resistance per pole is provided as a general indication for a new device.
The value of the contact resistance must be determined on the basis of the measured voltage drop, in accordance with the manufacturer's test procedure.

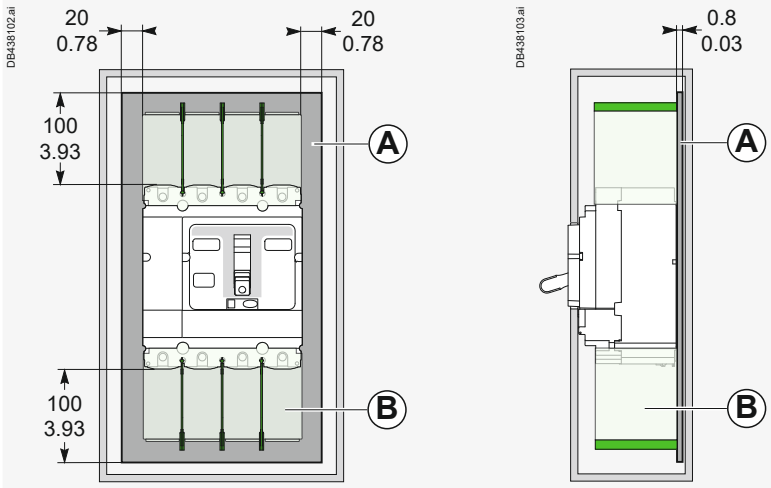
ComPacT NSX DC EP
Safety Clearances and Minimum Distances

Safety Clearance Using Terminals Shields

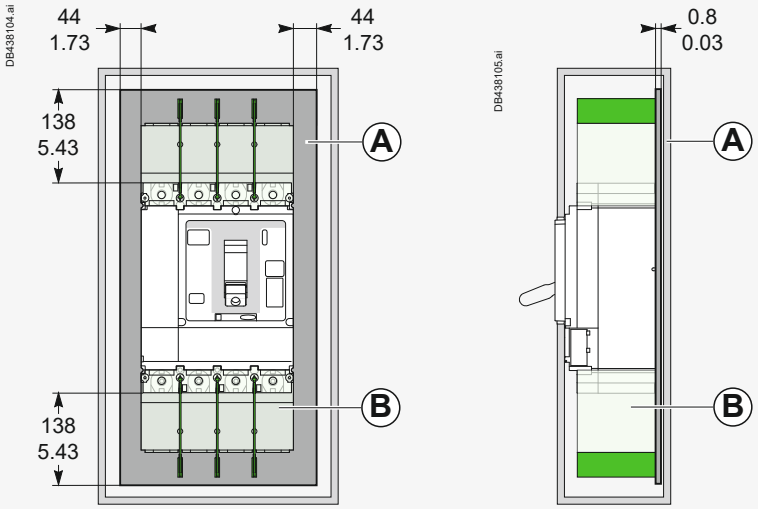
- Terminal shields must be used with all DC EP circuit breakers when operating at 1500 V DC.
- Terminal shields can be used in option with DC EP switch-disconnectors (U ⩽ 1500 V DC).

Minimal distance between two adjacent devices (ComPacT NSX250 TM DC EP and ComPacT NSX250 NA DC EP)



(A) Insulating screen (LV429331) or fiber insulating plate to be made by the customer.
(B) Interphase barriers (LV429329) or terminal shield.

Minimal distance between two adjacent devices (ComPacT NSX500 TM DC EP and ComPacT NSX630 NA DC EP)



(A) Insulating screen (LV432579) or fiber insulating plate to be made by the customer.

(B) Interphase barriers (LV432570) or terminal shield.

Note:
The device must be installed in an IP5x enclosure. The thermal behavior of switchgear and enclosures warrants careful monitoring. PV generator boxes and array boxes are usually installed outdoors and exposed to the elements. In the event of high ambient temperatures, high IP levels could reduce air flow and thermal power dissipation.
In addition, the way switchgear devices achieve high voltage operation - i.e. through the use of poles in series - increases their temperature. Special attention should therefore be paid to the temperature of switchgear inside outdoor enclosures on the DC side.
Schneider Electric recommends checking the installation as per IEC 61439 or any other equivalent standard.

ComPacT NSX DC EP
Temperature Derating

ComPacT switch-disconnectors have been tested for operation in industrial atmospheres. It is recommended that the equipment be cooled or heated to the proper operating temperature and kept free of excessive vibration and dust.

For ComPacT NSX the overload protection is calibrated at 40 °C or 50 °C. This means that when the ambient temperature is less or greater than these temperatures, the Ir protection pickup is slightly modified.
- calibrated at 40 °C: heatsink on bottom & four cables on top, with terminal shields
- calibrated at 50 °C: standard cable with phase barrier connections with section and length according to IEC60947-1 Table 9 and 10.

[1] Values in the table are provided for standard cable with phase barrier configuration
- See the tripping curves for 50 °C.
- Determine tripping times corresponding to the Ir value (thermal setting on the device), corrected for the breaker ambient temperature as indicated in the tables below
- For heatsink on bottom & four cables on top,with terminal shield. Ir value is always equal In when ambient temperature ≤ 40 °C; in case of ambient temperature > 40°; consult us.

[2] Temperature rise have been checked with cables that section and length according IEC60947-1 Table 9 and 10.

The values indicated in the tables opposite are typical values.

Power dissipated per pole (P/pole) in Watts (W)

The value indicated in the table is the power dissipated at I_N, four-pole switchboard (these values can be higher than the power calculated on the basis of the pole resistance). Measurement and calculation of the dissipated power are carried out in compliance with the recommendations of Annex G of standard IEC 60947-2.

Resistance per pole (R/pole) in milliohms (mΩ)

The value of the resistance per pole is provided as a general indication for a new device.
The value of the contact resistance must be determined on the basis of the measured voltage drop, in accordance with the manufacturer's test procedure.

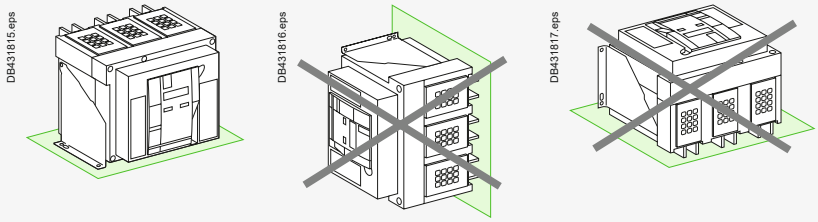
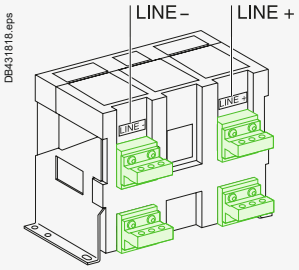
MasterPact NW10 to NW40 DC, EPDC, DC PV
Installation in Switchboard

Possible Positions



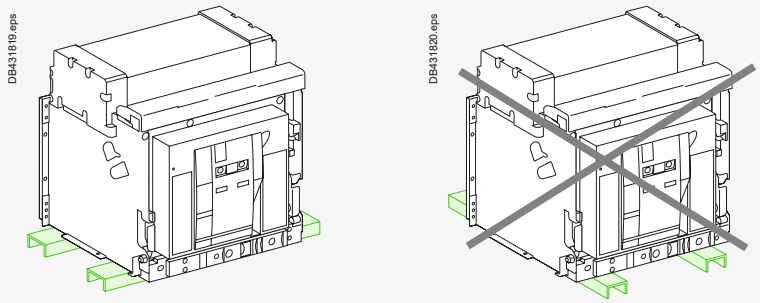
Power Supply

The plus and minus polarities **(LINE + and LINE -)** of the power supply must be connected as indicated in the “Dimensions and connection” chapter.

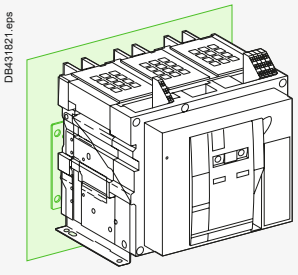


Mounting the Circuit Breaker

It is important to distribute the weight of the device uniformly over a rigid mounting surface such as rails or a base plate.
This mounting plane should be perfectly flat (tolerance on support flatness: 2 mm). This eliminates any risk of deformation which could interfere with correct operation of the circuit breaker.
MasterPact devices can also be mounted on a vertical plane using the special brackets.



Mounting on rails

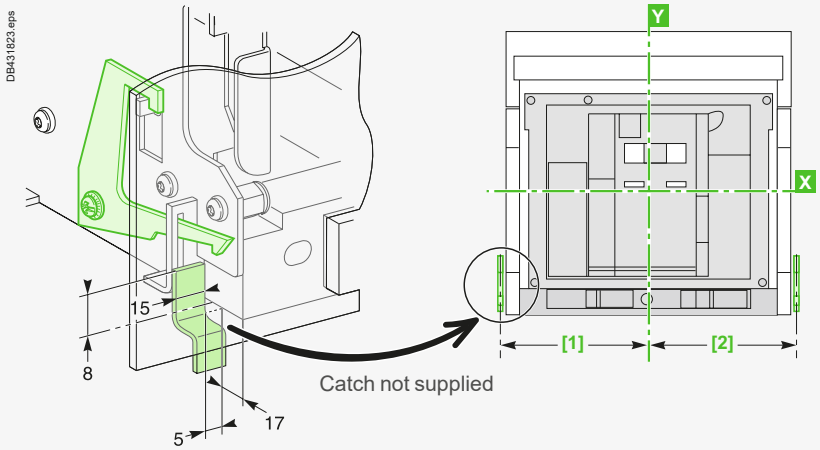


Mounting with vertical brackets

MasterPact NW10 to NW40 DC, EPDC, DC PV
Door Interlock

Mounted on the right or left-hand side of the craddle, this device inhibits opening of the cubicle door when the circuit breaker is in “connected” or “test” position.
If the breaker is put in the “connected” position with the door open, the door may be closed without having to disconnect the circuit breaker.

Door Interlock Catch VPEC



Dimensions (mm)

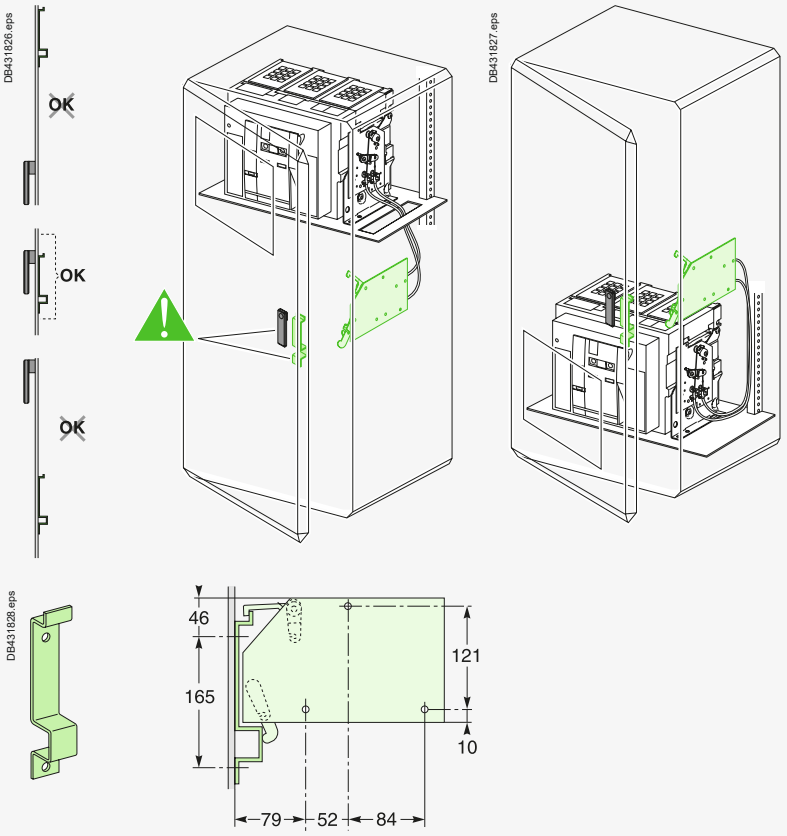
MasterPact NW10 to NW40 DC, EPDC, DC PV
Cable-Type Door Interlock - Connection of MN, MX and XF Voltage Releases

Cable-Type Door Interlock IPA

This option avoids door opening when the circuit breaker is closed and avoids circuit breaker closing when the door is open.
For this, a special plate associated with a lock and a cable is mounted on the right side of the circuit breaker.
With this interlock installed, the source changeover function cannot be implemented.



Wiring of Voltage Releases

During pick-up, the power consumed is approximately 150 to 200 VA. For low control voltages (12, 24, 48 V), maximum cable lengths are imposed by the voltage and the cross-sectional area of cables.

Recommended Maximum Cable Lengths (Meter)

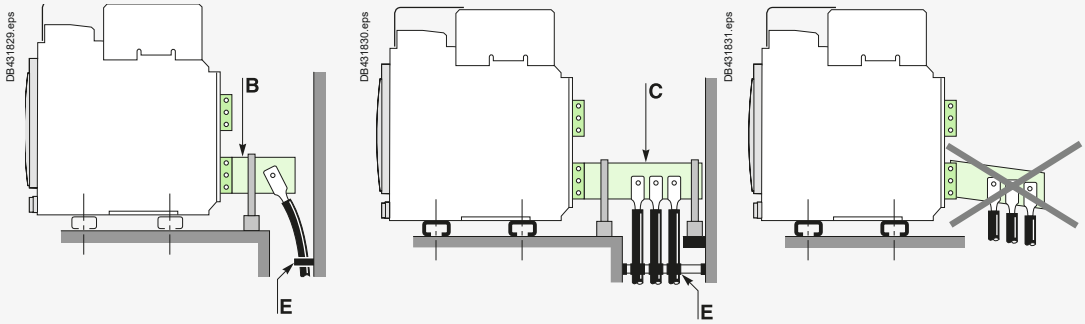
		12 V		24 V		48 V	
		2.5 mm²	1.5 mm²	2.5 mm²	1.5 mm²	2.5 mm²	1.5 mm²
MN	U source 100 %	-	-	58	35	280	165
	U source 85 %	-	-	16	10	75	45
MX-XF	U source 100 %	21	12	115	70	550	330
	U source 85 %	10	6	75	44	350	210

Note: The indicated length is that of each of the two wires.

Cable Connections

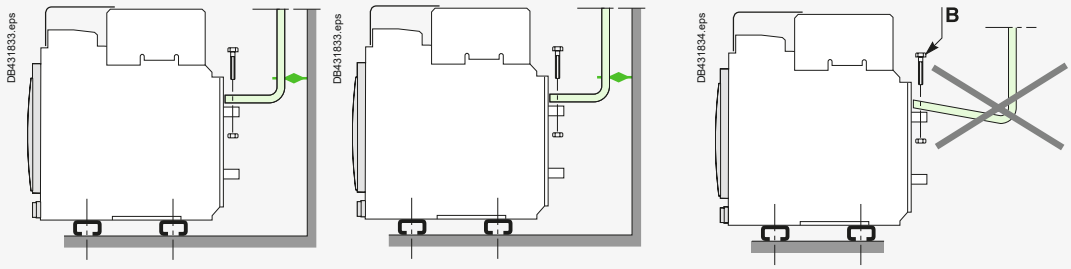
If cables are used for the power connections, make sure that they do not apply excessive mechanical forces to the circuit breaker terminals.
For this, make the connections as follows:

- Extend the circuit breaker terminals using short bars designed and installed according to the recommendations for bar-type power connections:
  - For a single cable, use solution **B** opposite
  - For multiple cables, use solution **C** opposite.
- In all cases, follow the general rules for connections to busbars:
  - Position the cable lugs before inserting the bolts
  - The cables should firmly tightened to the framework of the switchboard **E**.



Busbar Connections

The busbars should be suitably adjusted to ensure that the connection points are positioned on the terminals before the bolts are inserted **B.** The connections are held by the support which is solidly fixed to the framework of the switchboard, such that the circuit breaker terminals do not have to support its weight **C**. (This support should be placed close to the terminals).

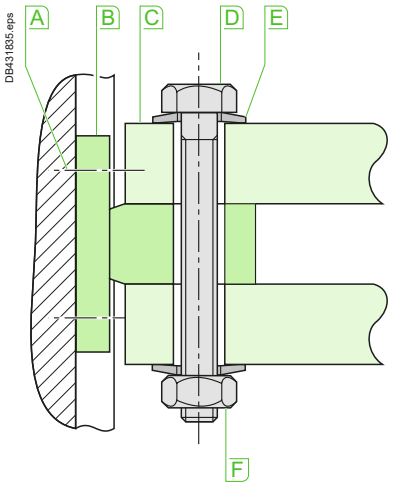


Electrodynamic Stresses

The first busbar support or spacer shall be situated within a maximum distance from the connection point of the breaker (see table below). This distance must be respected so that the connection can withstand the electrodynamic stresses between phases in the event of a short circuit.

Maximum distance A between busbar to circuit breaker connection and the first busbar support or spacer with respect to the value of the prospective short-circuit current.					
Isc (kA)	30	50	65	80	100
distance A (mm)	350	300	250	150	150

MasterPact NW10 to NW40 DC, EPDC, DC PV
Power Connection

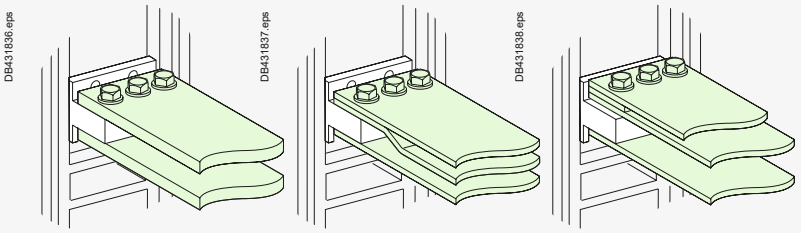


A Terminal screw factory-tightened to 16 Nm
B Breaker terminal
C Busbar
D Bolt
E Washer
F Nut

Clamping

Correct clamping of busbars depends amongst other things, on the tightening torques used for the nuts and bolts. Over-tightening may have the same consequences as under-tightening.
For connecting busbars (Cu ETP-NFA51-100) to the circuit breaker, the tightening torques to be used are shown in the table below.
These values are for use with copper busbars and steel nuts and bolts, class 8.8.
The same torques can be used with AGS-T52 quality aluminium bars (French standard NFA 02-104 or American National Standard H-35-1).

Examples



Tightening torques

Conductor Materials and Electrodynamic Stresses

ComPacT NSX DC circuit breakers can be connected indifferently with bare-copper, tinned-copper and tinned-aluminium conductors (flexible or rigid bars, cables).
In the event of a short-circuit, thermal and electrodynamic stresses will be exerted on the conductors. They must therefore be correctly sized and held in place by supports.
Electrical connection points on switchgear devices (switch-disconnectors, contactors, circuit breakers, etc.) should not be used for mechanical support.
Any partition between upstream and downstream connections of the device must be made of non-magnetic material.

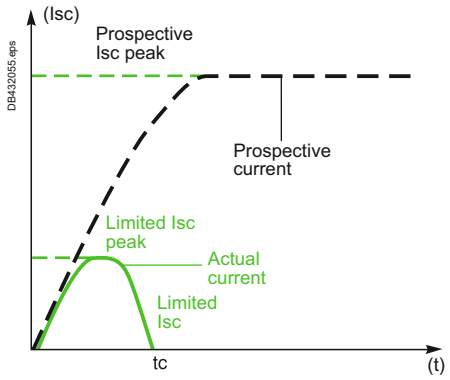
Current and Energy Limiting Curves

The limiting capacity of a circuit breaker is its aptitude to let through a current, during a short-circuit, that is less than the prospective short-circuit current.



The exceptional limiting capacity of the ComPacT NSX DC range is due to the rotating double-break technique (very rapid natural repulsion of contacts and the appearance of two arc voltages in-series with a very steep wave front).

Ics = 100 % Icu

The exceptional limiting capacity of the ComPacT NSX DC range greatly reduces the forces created by fault currents in devices.
The result is a major increase in breaking performance.
In particular, the service breaking capacity Ics is equal to 100 % of Icu.
The Ics value, defined by IEC standard 60947-2, is ensured by tests comprising the following steps:

- Break three times consecutively a fault current equal to 100 % of Icu
- Check that the device continues to function normally, that is:
  - It conducts the rated current without abnormal temperature rise
  - Protection functions perform within the limits specified by the standard
  - Suitability for isolation is not impaired.

Longer Service Life of Electrical Installations

Current-limiting circuit breakers greatly reduce the negative effects of short-circuits on installations.

Thermal Effects

Less temperature rise in conductors, therefore longer service life for cables.

Mechanical Effects

Reduced electrodynamic forces, therefore less risk of electrical contacts or busbars being deformed or broken.

Electromagnetic Effects

Fewer disturbances for measuring devices located near electrical circuits.

Current and Energy Limiting Curves

The limiting capacity of a circuit breaker is expressed by two curves which are a function of the prospective short-circuit current (the current which would flow if no protection devices were installed):

- The actual peak current (limited current)
- Thermal stress (A^2s), i.e. the energy dissipated by the short-circuit in a conductor with a resistance of 1 Ω.

Example

What is the real value of a 150 kA rms prospective short-circuit (i.e. 330 kA peak) limited by an NSX250L DC upstream ?
The answer is 30 kA peak (curve page E-14).

Maximum Permissible Cable Stresses

The table below indicates the maximum permissible thermal stresses for cables depending on their insulation, conductor (Cu or Al) and their cross-sectional area (CSA). CSA values are given in mm^2 and thermal stresses in A^2s.

CSA		1.5 mm²	2.5 mm²	4 mm²	6 mm²	10 mm²
PVC	Cu	2.97×10^4	8.26×10^4	2.12×10^5	4.76×10^5	1.32×10^6
	Al					5.41×10^5
PRC	Cu	4.10×10^4	1.39×10^5	2.92×10^5	6.56×10^5	1.82×10^6
	Al					7.52×10^5
CSA		**16 mm²**	**25 mm²**	**35 mm²**	**50 mm²**	
PVC	Cu	3.4 x 106	8.26 x 106	1.62 x 107	3.31 x 107	
	Al	1.39 x 106	3.38 x 106	6.64 x 106	1.35 x 107	
PRC	Cu	4.69 x 106	1.39 x 107	2.23 x 107	4.56 x 107	
	Al	1.93 x 106	4.70 x 106	9.23 x 106	1.88 x 107	

Example

Is a Cu/PVC cable with a CSA of 10 mm^2 adequately protected by an NSX160F.
The table above indicates that the permissible stress is 1.32×10^6 A^2s.
All short-circuit currents at the point where an NSX160F (Icu = 35 kA) is installed are limited with a thermal stress less than 6×10^5 A^2s (curve page E-14).
Cable protection is therefore ensured up to the limit of the breaking capacity of the circuit breaker.

F

NW10 DC to NW40 DC Fixed and Drawout Circuit Breakers and Switch-Disconnectors

A MasterPact DC circuit breaker is described by 2 catalog numbers corresponding to:
- The basic circuit breaker (fixed or drawout with chassis, including the power connections)
- A control unit.

A MasterPact switch-disconnector is described by 1 catalog number corresponding to:
- The switch-disconnector (fixed or drawout with chassis, including the power connections). Vertical connection is standard however the connectors can be rotated for on-site conversion to horizontal connection (except on the NW40). A communication option and various auxiliaries and accessories may also be added.

AC - NW actuator for 6 CE - 3 CD - 0 CT additional carriage switches			Qty ☐

Remote operation

Electrical operation	**MCH** - gear motor	**V** ☐
	XF - closing voltage release	**V** ☐
	MX - opening voltage release	**V** ☐
	PF - "ready to close" contact	Low level ☐
		6 A/240 V AC ☐
	BPFE - electrical closing pushbutton	☐
	RES - electrical reset option	**V** ☐
	RAR - automatic reset option	☐
Remote tripping	**MN** - undervoltage release	**V** ☐
	R - delay unit (non-adjustable)	☐
	Rr - adjustable delay unit	☐
	2e MX - shunt release	**V** ☐

Locking

VBP - ON/OFF pushbutton locking (by transparent cover + padlocks) ☐

OFF position locking:

VCPO - by padlocks ☐

VSPO - by keylocks	Keylock kit (w/o keylock)	Profalux	☐	Ronis	☐
	1 keylock	Profalux	☐	Ronis	☐
	2 identical keylocks, 1 key	Profalux	☐	Ronis	☐
	2 keylocks, different keys	Profalux	☐	Ronis	☐

Chassis locking in "disconnected" position:

VSPD - by keylocks	Keylock kit (w/o keylock)	Profalux	☐	Ronis	☐
		Kirk	☐	Castell	☐
	1 keylock	Profalux	☐	Ronis	☐
	2 identical keylocks, 1 key	Profalux	☐	Ronis	☐
	2 keylocks, different keys	Profalux	☐	Ronis	☐
	Optional connected/disconnected/test position locking				☐

VPEC - door interlock	On right-hand side of chassis	☐
	On left-hand side of chassis	☐

VPOC - racking interlock ☐
IPA - cable-type door interlock ☐
VDC - mismatch protection ☐
VIVC - shutter position indication and locking ☐
IBPO - racking interlock between crank and OFF pushbutton for NW ☐
DAE - automatic spring discharge before breaker removal for NW ☐

Accessories

VO - safety shutters on chassis ☐
CDM - mechanical operation counter ☐
CB - auxiliary terminal shield for chassis ☐
CDP - escutcheon ☐
CP - transparent cover for escutcheon ☐
OP - blanking plate for escutcheon ☐
KMT - Grounding kit ☐
